INTRODUCTION

This is the 62nd annual report of the U.S. International Trade Commission on Domestic production and sales of synthetic organic chemicals and the raw materials from which they are made. The report consists of 15 sections, each covering a specified group (based principally on use) of organic chemicals as follows: Tar and tar crudes; crude products from petroleum and natural gas for chemical conversion; cyclic intermediates; dyes; organic pigments; medicinal chemicals; flavor and perfume materials; plastics and resin materials; rubber-processing chemicals; elastomers; plasticizers; surface-active agents; pesticides and related products; miscellaneous end-use chemicals and chemical products; and miscellaneous cyclic and acyclic chemicals. Data have been supplied by approximately 800 producers.

Five of the 15 statistical sections are headed by a short paper on recent developments in part or all of the given end-use group. This is followed by a summary of the statistical data. The first table in each section gives statistics on products and groups of products in as great detail as is possible without revealing the operations of individual producers. Statistics for an individual chemical or group of chemicals are given only when there are three or more producers, no one or two of which may be predominant. Moreover, even when there are three or more producers, statistics are not given if there is any possibility that their publication would violate the statutory provisions relating to unlawful disclosure of information accepted in confidence by the Commission.¹

Data are reported by producers for only those items where the volume of production or sales or value of sales exceeds certain minimums. Those minimums for all sections are 5,000 pounds of production or sales or \$5,000 of value of sales with the following exceptions: Plastics and resin materials--50,000 pounds or \$50,000; pigments, medicinal chemicals, flavor and perfume materials, rubber-processing chemicals, and elastomers--1,000 pounds or \$1,000. They are usually given in terms of undiluted materials; however, products of 95 percent or more purity are considered to be 100 percent pure. Commercial concentrations are applied to dyes, certain plastics and resins, and a few solvents; such concentrations are specifically noted.

The statistics given in this report include data from all known domestic producers of the item covered and include the total output of each company's plants, i.e., the quantities produced for consumption within the producing plant, as well as the quantities produced for domestic and foreign sale. The quantities reported as produced, therefore, generally exceed the quantities reported as sold. Some of these differences, however, are attributable to changes in inventory.

The second table in each section lists all items for which data on production or sales have been reported, by primary manufacturers, identified by manufacturers' codes. Each code consists of not more than three capital letters which is assigned on a permanent basis.

The third table in each section is a directory, alphabetized by the codes of the manufacturers reporting in that section.

Table 1 of the Appendix is a directory, alphabetized by the names of the manufacturers reporting in all sections and includes their office addresses.

Table 2 of the Appendix summarizes and gives the competitive status of U.S. general imports in 1976 of benzenoid intermediates and finished benzenoid products, entered under schedule 4, parts 1B and 1C, of the Tariff Schedules of the United States.

Table 3 of the Appendix lists synonymous names for cyclic intermediates. Information on all synonymous names of the organic chemicals included in this report may be found in the *SOCMA Handbook: Commercial Organic Chemical Names*, published by the Chemical Abstracts Service of the American Chemical Society, or the *Color Index* (Revised Third Edition), published jointly by the Society of Dyes and Colourists and the American Association of Textile Chemists and Colourists.

As specified in the reporting instructions sent to manufacturers, production and sales (unless otherwise specified) are defined as follows:

PRODUCTION is the total quantity of a commodity made available by ORIGINAL MANUFACTURERS ONLY within the customs territory of the United States (includes the 50 states, the District of Columbia, and Puerto Rico). It covers synthetic organic chemicals, specified crudes from petroleum and coal tar, and certain chemically described natural products, such as, alkaloids, enzymes, and perfume isolates. It is the sum--expressed in terms of 100% active ingredient--unless otherwise specified in the reporting instructions--of the quantities:

Produced, separated, and consumed in the same plant or establishment. A commodity is considered separated either when it is isolated from the reaction system or when it is not isolated, but weighed, analyzed, or otherwise measured. This includes byproducts and co-products that are not classifiable as waste materials;

¹Title 18, U.S.C. 1905 and Title 44, U.S.C. 3508.

INTRODUCTION

Produced and not isolated, but directly converted to a finished or semifinished item not included in this report (e.g., polyester film, polyurethane tires, nylon fiber, bar soap, etc.). (See specific instructions in individual sections);
 Produced and transferred to other plants or establishments of the same firm or 100%-owned subsidiaries or affiliates;
 Produced and sold to, or bartered with, other firms (including less than 100% owned subsidiaries);
 Produced for others under toll agreements (see general instructions);
 Produced and held in stock.

PRODUCTION EXCLUDES:

Purification of a commodity, which is purchased by, or transferred from within, your company, unless inclusion of such processing is specifically requested in the reporting instructions for individual sections;
 Intermediate products which are formed in the manufacturing process, but are not isolated from the reaction system--that is, not weighed, analyzed, or otherwise measured; except such products as described above as being produced and not isolated, but directly converted to a finished or semifinished item.
 Materials that are used in the process but which are recovered for re-use or sale;
 Waste products having no economic significance.

SALES are actual quantities of commodities sold by ORIGINAL MANUFACTURERS ONLY. Sales include the quantity and value of:

Shipments of a commodity for domestic use or for export, or segregation in a warehouse when title has passed to the purchaser in a bona fide sale;
 Shipments of a commodity produced for you by others under toll agreements;
 Shipments to subsidiary or affiliated companies, provided the ownership is less than 100%.

SALES EXCLUDES:

All intra-company transfers within a corporate entity;
 All shipments to 100% owned subsidiary or affiliated companies;
 All residues of imported or purchased material, including materials obtained by barter;
 All shipments of a commodity produced for others under toll agreements.

VALUE OF SALES is the net selling price f.o.b. plant or warehouse, or delivered price. F.o.b. prices are preferred, but if they are not readily available from your records, delivered prices are acceptable.

Combined production of all synthetic organic chemicals, tar, and primary products from petroleum and natural gas in 1978 was 320,891 million pounds—an increase of 4.7 percent over the output in 1977 (see table 1). Sales of these materials in 1978, which totaled 170,488 million pounds, valued at \$41,511 million, were 5.4 percent larger than in 1977 in terms of quantity and 8.5 percent larger in terms of value. These figures include data on production and sales of chemicals measured at several successive steps in the manufacturing process, and therefore, they necessarily reflect some duplication.

In 1978, production of all synthetic organic chemicals, including cyclic intermediates and finished products, totaled 186,657 million pounds, or 7.0 percent more than the output in 1977. All sections except those on dyes, rubber-processing chemicals, and elastomers, showed an increase in production in 1978 over 1977. Flavor and perfume materials (189 million pounds) led the increase with a gain of 26.0 percent; plasticizers (2,086 million pounds) increased 16.4 percent; plastics and resin materials (38,878 million pounds) increased 12.3 percent; medicinal chemicals (269 million pounds) and organic pigments (77 million pounds) each increased 11.6 percent; cyclic intermediates (19,936 million pounds) increased 6.5 percent; miscellaneous end-use chemicals and chemical products (20,589 million pounds) increased 6.4 percent; miscellaneous cyclic and acyclic chemicals (92,101 million pounds) increased 5.9 percent; pesticides and related products (1,416 million pounds) increased 2.0 percent; and surface-active agents (4,738 million pounds) increased 0.4 percent. Rubber-processing chemicals (366 million pounds) decreased 9.0 percent; dyes (251 million pounds) decreased 4.9 percent; and elastomers (5,761 million pounds) decreased 0.9 percent.

SYNTHETIC ORGANIC CHEMICALS, 1978

GENERAL

In this report synthetic organic chemicals are classified on the basis of their principal use as follows: cyclic intermediates, dyes, organic pigments, medicinal chemicals, flavor and perfume materials, plastics and resin materials, rubber-processing materials, elastomers, plasticizers, surface-active agents, pesticides and related products, miscellaneous end-use chemicals and chemical products, and miscellaneous cyclic and acyclic chemicals. Most of these groups are further subdivided either by use or by chemical composition. As intermediate chemicals are used in the manufacture of finished products, aggregate figures that cover both intermediates and finished products necessarily include considerable duplication.

Total production of synthetic organic chemicals (intermediates and finished products combined) in 1978 was 186,657 million pounds or 7.0 percent more than the output of 174,482 million pounds reported for 1977 and 78.3 percent more than the output of 104,711 million pounds reported for 1967 (see table 2). Sales of synthetic organic chemicals in 1978 amounted to 103,260 million pounds, valued at \$35,531 million, compared with 97,836 million pounds, valued at \$32,438 million in 1977 and 55,177 million pounds, valued at \$10,438 million in 1967. Production of all cyclic products (intermediates and finished products combined) in 1978 totaled 45,826 million pounds or 9.3 percent more than the 41,922 million pounds reported for 1977 and 36.9 percent more than the 33,479 million pounds reported for 1967, however, the transfer of several items, in 1976, from the cyclic intermediates section to the section on primary production from petroleum and natural gas has caused the output of cyclic products to appear much lower in relation to 1967 than would otherwise have resulted. Production of all acyclic products in 1978 totaled 140,831 million pounds, or 6.2 percent more than the 132,560 million pounds reported for 1977 and 97.7 percent more than the 71,232 million pounds reported for 1967.

Tar

Coal tar is produced chiefly by the steel industry as a byproduct of the manufacture of coke; water-gas tar and oil-gas tar are produced by the fuel-gas industry. Production of coal tar, therefore, depends on the demand for steel; production of water-gas tar and oil-gas tar reflects the consumption of manufactured gas for industrial and household use. Water-gas and oil-gas tars have properties intermediate between those of petroleum asphalts and coal tar. Petroleum asphalts are not usually considered to be raw materials for chemicals.

The quantity of coal tar produced in the United States in 1978 amounted to 540 million gallons (see table 1). Production in 1978 was 8.8 percent less than the 593 million gallons of coal tar produced in 1977. Sales of coal tar in 1978 amounted to 295 million gallons compared with 292 million gallons in 1977. U.S. production of water-gas and oil-gas tars was not reported to the Commission for 1977 or 1978; production of these tars in 1968 amounted to 21 million gallons, according to trade publications.

Tar Crudes

Tar crudes are obtained from coke-oven gas and by distilling coal tar, water-gas tar, and oil-gas tar. The most important tar crudes are benzene, toluene, xylene, creosote oil, and pitch of tar. Some of these products are identical with those obtained from petroleum. Data for materials obtained from petroleum are included, for the most part, with the statistics for like materials obtained from coke-oven gas and tars, and are shown in tables 1 and 1B.

Domestic production of industrial and specification grades of benzene reported by coke-oven operators and petroleum refinery operators in 1978 amounted to 1,488 million gallons--3.7 percent more than the 1,435 million gallons reported for 1977. These statistics include data for benzene produced from light oil and petroleum. Sales of benzene by coke-oven operators and petroleum refiners in 1978 amounted to 757 million gallons compared with 659 million gallons in 1977. In 1978 the output of toluene (including material produced for use in blending in aviation fuel) amounted to 1,054 million gallons--3.6 percent more than the 1,018 million gallons reported for 1977. Sales of toluene (Nitration grade, 1°) in 1978 were 695 million gallons compared with 457 million gallons in 1977. The output of xylene in 1978 (including that produced for blending in motor fuels) was 845 million gallons, compared with 811 million gallons in 1977. Over 99 percent of the 845 million gallons of xylene produced in 1978 was obtained from petroleum sources. Sales of xylene increased slightly to 446 million gallons in 1978 compared with 426 million gallons in 1977.

Production and sales figures on crude naphthalene from coal-tar oils in 1978 could not be published without disclosing the operations of individual companies. Production of petroleum-derived naphthalene in 1978 amounted to 157 million pounds, compared with 151 million pounds in 1977. Production figures on road tar for 1978 cannot be published; in 1972 production amounted to 30 million gallons.

Some of the products obtained from tar and included in the statistics in table 1 are obtained from other products for which data are also included in the table. The statistics, therefore, involve considerable duplication, and for this reason no group totals or grand totals are given.

Data for 1978 tar crudes were supplied by 8 companies and company divisions.

²Includes only data for coal tar reported to the Office of Energy Data and Interpretation, Energy Information Administration, Department of Energy (Energy Data Reports, Coke & Coal Chemicals, in December 1978, February, 1979). At date of publication, sales value for coal tar was not available. Data on U.S. production of water-gas tar and oil-gas tar are not collected by the U.S. International Trade Commission, but according to trade publications, production of these tars amounted to 21 million gallons in 1968.

³Data reported by tar distillers are not included because publication would disclose the operations of individual companies. At date of publication, sales value for coke-oven operators was not available.

⁴Includes data for material produced for use in blending motor fuels. The annual production statistics for petroleum refiners on benzene, toluene, and xylene are not comparable with the combined monthly production figures because of fiscal year revisions.

⁵Sales value figures are estimated from Energy Data Reports, Coke & Coal Chemicals, in December, 1978, February, 1979.

⁶Benzene, specification grades (1°, 2°) only.

⁷Data from coke-oven operators was unavailable at time of publication.

⁸In 1978, production of coal-tar solution containing creosote (100% solution basis) amounted to 46,937 thousand gallons; sales were 34,411 thousand gallons, valued at 21,557 thousand dollars, with a unit value of \$0.63 per gallon.

SECTION II -- PRIMARY PRODUCTS FROM PETROLEUM AND NATURAL GAS 13

FOR CHEMICAL CONVERSION

PETROCHEMICALS AND THE GASOLINE MARKET

Louis N. DeToro

"Primary products" derived from petroleum and natural gas are the raw material inputs for nearly every synthetic organic chemical. Some 25 percent of these primary products consist of benzene, toluene, and xylenes (so-called "aromatic" petrochemicals). About 65 percent of the primary products is aliphatic hydrocarbons such as ethylene, propylene, and butadiene. The remainder consists of naphthenes and miscellaneous petrochemicals such as butanes and cyclohexane.

Seventy-five companies produced primary products in 1978. The producers are oil companies and chemical companies, including some of the largest firms in both categories. It is not unusual for any of these large oil refiners or chemical companies to have the capacity to produce from 50 to 200 million gallons per year of a large volume primary petrochemical, such as benzene or ethylene.

Production of primary products from petroleum and natural gas in 1978 was about 129 billion pounds (table A), representing an average rate of increase of 7.2 percent per year since 1973. Sales quantities have grown from 50 billion pounds in 1973 to over 64 billion pounds in 1978, representing an average rate of increase of 5.1 percent per year. The difference in the growth rates indicates an increase in the relative share of captive consumption of the primary products being used to make other petrochemicals.

The primary products price index¹ more than doubled from 1973 to 1974 (table A), which was expected given the quadrupling of crude oil prices during that period. Employee wages contribute a relatively small part to the price increases in this capital-intensive industry. Since 1974, the price index has continued to increase, albeit at a much slower pace than that which occurred during the 1973-74 period of the Arab oil embargo. Preliminary estimates for 1978 indicate an increase of about 5 percent per year² in producer prices since 1974. Surprisingly, primary product price increases have been smaller than those of wholesale manufactured goods prices in general, and the price index for chemicals and allied products as a whole, since 1974.

¹This price index for primary products, as discussed herein, is based on selected individual chemicals which compose 60 percent of the value of sales of all primary products, i.e., benzene, butadiene, ethylene, propylene, tetra- and tripropylene, toluene, cumene, cyclohexane, o-xylene, p-xylene, and styrene monomer.

²This figure is supported by the 8.2 percent per year rise in petroleum refiners' costs for acquiring crude oil for the same period, coupled with the two-thirds passthrough indicative of crude oil cost increases passed on to the primary products producers.

Of the primary products from petroleum and natural gas, the aromatics are among the most consequential, both as petrochemical building blocks and as fuel additives. These chemicals, benzene, toluene, and xylenes, and their markets are the subject of the remainder of this paper.

Aromatics and the Gasoline Market

The use of aromatics--benzene, toluene, and xylenes (BTX)¹--as gasoline components as well as petrochemicals is a matter of serious concern to the chemical industry now that the energy shortage is likely to continue. Aromatics' primary use is in lead-free gasoline in which they are essential to improve the antiknock rating. The chemical industry fears that it might be denied BTX supply in a future period of gasoline shortage.

BTX are derived mainly from petroleum refinery streams² and pyrolysis gasoline³ obtained during the manufacture of olefins such as ethylene. Benzene is also made by the hydrodealkylation (HDA) of toluene.⁴ A minor source of aromatics is coal tar, a byproduct of coke-oven operations. Consisting of about one-quarter of the tonnage of raw materials from synthetic organic chemicals, aromatics are vital to the production of synthetic fibers, plastics, drugs, and other synthetic organic chemicals (i.e., petrochemicals). While irreplaceable in a number of chemical end uses, the high-octane rating of BTX also makes their use as an octane-raising component in gasoline extremely important, as noted in the following list of octane ratings of gasoline components:

<u>Gasoline components</u>	<u>Research Octane No. (RON)</u>
Tertiary-butyl alcohol (TBA)-----	108
Methyl tertiary-butyl ether (MTBE)-----	115
Benzene-----	106
Toluene-----	110
Xylene-----	114
Straight-run gasoline-----	70
Catalytic cracker gasoline-----	92

¹Benzene (C₆H₆) is a clear, colorless, flammable liquid of a characteristic odor (hence "aromatic") and it is both narcotic and toxic (which limits its use in gasoline). Toluene (C₆H₅CH₃) is a colorless, flammable liquid with a benzene-like odor. As compared with benzene, its vapors are less dangerously toxic and less flammable; it also has a lower rate of evaporation. Xylenes (C₆H₄(CH₃)₂) are a commercial mixture of 3 isomers, ortho-, meta-, and para-xylenes. The mixture is a clear liquid, toxic, and flammable.

²In refining petroleum, several products are extracted. Among these products is a stream known as catalytic reformat, of which aromatics are a part.

³"Pyrolysis" is the breaking down of complex materials into simpler units by use of heat. Pyrolysis gasoline is produced in steam-cracking operations during the manufacture of olefins from heavier feedstocks.

⁴Hydrodealkylation is a petroleum refining process by which hydrogen under pressure is used to convert the hydrocarbons in heavy reformates, catalytic cracking recycle stocks, or other streams of hydrocarbons, into other chemicals.

Aromatics for gasoline are contained in reformat itself (an integral part of oil refinery output) and also come from BTX which are separated from reformat and blended back into the gasoline "pool." This pool includes both petroleum and natural-gas liquid mixtures. About 20 percent of the pool is straight-run gasoline, natural-gas liquids, and other low-octane stocks; 40 percent is petroleum fractions resulting from other refinery operations such as catalytic cracking, hydrocracking, and isomerization (such fractions are of slightly higher octane ratings but still too low to run a modern gasoline engine efficiently);¹ 20-plus percent of the gasoline pool is reformat² which contains BTX; and the remainder is alkylates³ and octane-raising compounds, including BTX which has been separated from refinery streams and then blended back into the gasoline pool.

The economics of the use of BTX as an octane-raising component of gasoline is influenced by three major factors: demand for motor gasoline; availability and use of antiknock agents (including substitutes for tetraethyl lead); and demand for BTX in petrochemicals. As stated above, the concern of the chemical industry is that the third named factor may have the lowest priority. Each of these factors is discussed in the following sections.

Demand for motor gasoline

The quantity of BTX which goes to the gasoline pool as an octane-raising agent is related to the nation's demand for motor gasoline, especially the unleaded type. Demand for gasoline in 1978 and 1979 has influenced BTX demand more strongly than any other single factor. Unleaded gasoline now requires a major fraction of BTX to maintain its antiknock rating; its usage in the United States is increasing as older cars are replaced by newer models that require unleaded gas because they are equipped with catalytic converters to decrease air pollution; lead would poison the catalysts in these converters. However, overall gasoline usage may decline somewhat through the early 1980's.

Calculation of recent trends in motor vehicle use, vehicle miles of travel, fuel consumed, and a constructed trend in miles per gallon of fuel consumption, all of which determine motor gasoline demand, show some surprising results. While the number of owned vehicles in the United States has increased, the rate of increase was only 3 percent per year, from 125.7 million to 143.8 million, during the mid-1970's. Vehicle miles of travel increased more than 2 percent

¹"Catalytic" gasoline is formed in the presence of certain catalysts. "Cracking" is decomposition by heat, with or without catalysis. "Isomerization" is a process for converting hydrocarbons into compounds whose molecules have a different arrangement of atoms, but the same numbers and kinds of atoms, Condensed Chemical Dictionary.

²"Reforming" is the use of controlled heat and pressure to cause cracking and isomerization of hydrocarbons, Condensed Chemical Dictionary.

³"Alkylation" is a process used in petrochemical refining which causes the chemical combination of "isoparaffin" hydrocarbons with olefins, such as ethylene, Condensed Chemical Dictionary.

annually to nearly 1.5 trillion miles from 1973 to 1978, and fuel consumed increased at about 2 percent per year to about 120 billion gallons. Fuel consumption figures, combined with numbers of miles driven, indicate that "miles per gallon of fuel" were nearly constant in the mid-70's, rising from 11.84 mpg in 1973 to just over 12 mpg by 1978.¹ An estimate of the declining demand for motor gasoline, based solely upon projected motor vehicle registrations, miles logged, and fuel efficiencies, is as follows:²

Projected U.S. motor gasoline demand
(million barrels per day)

1980-----	7.2
1981-----	7.1
1982-----	7.0

Because large amounts of the aromatics are going to the gasoline pool, chemical purchasers of BTX are facing a buying "squeeze." This competitive situation will be only partially eliminated if falling gasoline demand actually occurs in the early 1980's. Further easing of the BTX pinch is possible if the Environmental Protection Agency (EPA) eases restrictions on certain antiknock agents as substitutes for tetraethyl lead.

Availability and use of antiknock agents

There are many different types of antiknock agents, old and new. The traditional antiknock agent is tetraethyl lead (TEL). The present EPA lead limit on the gasoline pool is 0.8 grams per gallon. Since many producers are currently operating under waivers, the actual average is nearly 1.3 grams/gallon. Imposition of a 0.5 grams/gallon limit has been postponed from October 1, 1979, to October 1, 1980.

Methyl tertiary-butyl ether (MTBE), a new product, has a research octane number of 115, making it slightly better than toluene. The problem, however, is lack of present production capacity. New plants, approved by the EPA some time ago, are now due on stream but will add only 0.2 percent to the volume of the unleaded gasoline pool (and have little effect on releasing BTX for petrochemical use).

Tertiary butyl alcohol (TBA) is somewhat worse than toluene as a blend for octane-raising purposes. Moreover, the presently available quantity of TBA is too small to have any significant impact. Ethanol (ethyl alcohol) has a blending octane of about 100. Unfortunately, while much work has been done on "gasohol," a mixture of ethanol and gasoline, it still takes more energy to produce a gallon

¹All data are drawn from the Motor Vehicle Manufacturers Association's Motor Vehicle Facts and Figures '78. Figures on miles per gallon of fuel consumed were calculated from raw data.

²See appendix to this paper for details on the methodology used in forecasting motor gasoline demand.

of ethanol than it contains.

Most of the BTX blended into gasoline enters as reformat. Toluene, the principal high-octane ingredient of BTX, has a research octane number of 110 and is the most common standard of comparison.

Methylcyclopentadienyl manganese tricarbonyl (MMT),¹ another newly developed agent, was used in unleaded and leaded gasoline until October 28, 1978, at which time the EPA banned its use in the unleaded gasoline pool. At that time its level of use was 1/16 grams/gallon in unleaded gas. At the expected future level of 1/32 grams/gallon in leaded gasolines, MMT will yield octane-improvement of 0.9 octane numbers; production capacity exists to produce quantities sufficient to fill the requirements of unleaded pools. Thus, if the EPA was to lift its MMT ban in unleaded gasoline, more than 2 billion gallons of toluene could be diverted, theoretically, for petrochemical use. That would be 2.5 times the amount of toluene currently used as a primary petrochemical in the production of synthetic organic chemicals. While there are other measures, such as conservation of gasoline, to free up the BTX necessary for chemical markets, removal of EPA restrictions on other octane improvers, such as MMT, is favored by the industry.

The increasing use of BTX in motor gasoline has caused an increase in contract prices and spiraling spot market prices for benzene in the petrochemical market; and benzene inventories have diminished markedly. Similar price movements have characterized toluene and xylenes. Industry observers are forecasting slower growth in the BTX petrochemical markets, partially owing to supply problems which in turn spring from the increasing market for aromatics in motor gasoline.

Demand for BTX in petrochemicals

Benzene used in gasoline was about 1,650 million gallons per year for the past several years, while production of benzene for chemical conversion in this period was approximately 1,400 million gallons. As a raw material for derivative chemicals, benzene is the major multiple-purpose aromatic. Strong markets exist for ethylbenzene/styrene (in polystyrene plastics), cyclohexane (in nylon), and cumene/phenol (in phenolic resins for construction, automobiles, appliances, and numerous other uses). The most substantial growth of benzene derivatives expected through 1985, however, will be in the aniline market (for urethanes and urethane elastomers which supply insulation for buildings).

Toluene through 1980 is expected to retain steady consumption in the chemical market at 900 million gallons. A much larger part of the total production of toluene will continue to go to the gasoline pool because of toluene's high-octane rating and because it is less carcinogenic than benzene. Currently, toluene's use in gasoline is running at 7.6 billion gallons per year, including material blended back into gasoline after separation.

¹About 1 gram of MMT equals 1.73 gallons of toluene as a blendstock.

The xylenes' total use in gasoline is currently 8.1 billion gallons per year while production for chemical conversion is about 860 million gallons.¹ Most of the xylene isomers' use in chemicals is shared between paraxylene and orthoxylene. Orthoxylene is used to make phthalic anhydride; its demand is likely to grow by about 2 percent per year through 1980. Paraxylene should increase at a 7 percent per year rate of growth.² Nearly all paraxylene goes to the manufacture of dimethyl terephthalate or terephthalic acid (for use in making polyester fibers).

U.S. exports of BTX in 1978 were 234 million gallons, which amounted to about 7 percent of U.S. production of 3,387 million gallons. U.S. imports of 179 million gallons amounted to about 5 percent of apparent U.S. consumption of BTX (tables B, C, and D). The ratio of exports to imports in 1978 was 1.3. Since 1974, exports have increased while imports have decreased; the ratio of exports to imports in 1974 was only 0.8. This change in the trade pattern is the result of the turmoil in the world energy markets that began with the OPEC oil embargo and price increases of 1973-74.

Prices for all the basic aromatics increased in 1978 and 1979, owing to several factors, mainly higher prices of crude oil and also plant mechanical difficulties. Projected declining demand for gasoline in the early 1980's would alleviate some of the price pressure on BTX. In the interim, however, the buying squeeze is on, with few options available to aromatics purchasers to alleviate a very tight market situation.

¹Xylenes as used here is composed of three isomers, ortho-, meta-, and paraxylene. The isomers have the same chemical formula, however, the chemical structure of each isomer is unique.

APPENDIX

The motor gasoline demand extrapolation developed for this paper consists of the following mathematical formula:

$$G_D = \sum_v [N_v * MPV_v * (1/MPG_v)] \quad v = t_1, t_2, \dots, t_n$$

Motor gasoline demand (G_D) is equal to the number of current vehicle registrations (N_v) multiplied by the miles driven per vehicle (MPV_v), yielding total miles logged, which in turn is multiplied by the reciprocal of vehicle miles per gallon ($1/MPG_v$), yielding gallons of motor gasoline demanded. The multiplication process is carried out for each of several vehicle types ($v = t_1, t_2, \dots, t_n$) and the motor gasoline demanded for each vehicle type is summed (\sum_v) to yield overall demand for motor gasoline.

In this paper, statistics from the Motor Vehicle Manufacturers Association's Motor Vehicle Facts and Figures '78 were used to arrive at current and past trends of motor vehicle registrations, miles logged, fuel consumed, and miles per gallon of fuel consumption. Using these trends, projections were made of future values for these factors. Separate gasoline demand forecasts for several vehicle types (cars, lightweight trucks, other trucks, buses, and motorcycles) were calculated and then summed according to the above equation to arrive at projections of total U.S. gasoline demand.

PETROCHEMICALS AND THE GASOLINE MARKET

Louis N. DeToro

Primary products that are derived from petroleum and natural gas¹ are related to the intermediates and finished products made from such primary materials in much the same way that crude products derived from the distillation of coal tar are related to their intermediates and finished products. Many of the primary products derived from petroleum are identical with those derived from coal tar (e.g., benzene, toluene, and xylene). Considerable duplication exists in the statistics on the production and sales of primary petroleum products because some of these primary chemicals are converted to other primary products derived from petroleum and because data on some production and sales are reported at successive stages in the conversion process. The statistics are sufficiently accurate, however, to indicate trends in the industry. Many of the primary products for which data are included in the statistics may be used either as fuel or as basic materials from which other chemicals are derived. In this report every effort has been made to exclude data on materials that are used as fuel; however, data are included on toluene and xylene which are used in blending aviation and motor fuel.

The output of primary products derived from petroleum and natural gas as a group amounted to 128,947 million pounds in 1978. Production in 1977 was 131,133² million pounds. The output of aromatic and naphthenic products from petroleum amounted to 54,638 million pounds in 1978, compared with 52,263 million pounds in 1977. Sales amounted to \$2,663 million in 1978 and \$2,469 million in 1977. Production of benzene, toluene, and xylene from petroleum increased marginally in 1978, while the unit values of these products remained within one cent per pound of last year's unit values (table 1).

Production of all aliphatic hydrocarbons and derivatives from petroleum and natural gas was 74,308 million pounds in 1978, compared with 78,870 million pounds in 1977. Sales of these products were valued at \$3,497 million in 1978, compared with \$3,351 million in 1977. Production of ethylene was 25,955 million pounds in 1978--2.1 percent more than the 25,426 million pounds reported in 1977. The output of 1,3-butadiene in 1978 (3,515 million pounds) increased from the production in 1977 (3,259 million pounds).

Data for 1978 crude products from petroleum and natural gas for chemical conversion were supplied by 75 companies or company divisions.

¹Statistics on chemicals from coal tar are given in Section I (Tar and Tar Crudes) of this report.

IMPORTANT DEVELOPMENTS IN CYCLIC INTERMEDIATES IN 1978

Daniel F. McCarthy

While U.S. production, sales, and foreign trade in cyclic (benzenoid) intermediates in 1978 continued the upward trend established in 1973-77, the ratio of exports to imports remained almost the same (2 to 1).

More than 98 percent of the cyclic intermediates produced in the United States are benzenoid products, i.e., they have a chemical structure like or similar to that of a benzene or modified benzene ring. Almost all the benzenoid intermediates are produced from petroleum-derived aromatic compounds such as benzene, toluene, xylene, and naphthalene. A small amount of these aromatics, and thus some benzenoid intermediates, are produced from coal tar.

Cyclic (benzenoid) intermediates are used in the manufacture of products in all segments of the U.S. synthetic organic chemicals industry. The principal product classes derived from benzenoid intermediates and the percentage of benzenoids in each class in 1978 were dyes (100 percent); organic pigments (100 percent); rubber-processing chemicals (88 percent); plasticizers (85 percent); organic pesticides (56 percent); flavor and perfume materials (44 percent); medicinals (42 percent); and plastics (31 percent).

New Developments in 1978

In addition to increases in antipollution expenditures, a general increase in sales prices, and increased costs of raw materials, the changes in the classification of imports of benzenoid chemicals which were adopted during the Multilateral Trade Negotiations in Geneva will perhaps be judged to have been the most significant development in this industry in 1978. In conjunction with its proposal to eliminate the American selling price system for assessing duties on imports of benzenoid chemicals and products, the U.S. negotiating team presented, along with its offers list, a revised classification system for imports of benzenoid chemicals and products into the United States.¹ The new system segregates all benzenoid intermediates not specifically provided for in the existing Tariff Schedules of the United States (TSUS) into 20 major classes and many subclasses based on chemically functional groups of atoms within the molecule. Within each class, items which are now important in trade are specifically identified and provided for, and a number of residual or "basket" categories provide for products which may be imported in the future. This new system will allow a determination of the extent of domestic competition from imports of the thousands of benzenoid intermediates formerly classified in the TSUS "basket" item 403.60.

¹The revised classification system is included in the Trade Agreements Act of 1979, which was signed by the President on July 26, 1979.

Government regulations

In 1978, environmental regulations continued to increase the processing costs of producing cyclic intermediates. Feedstock costs, the principal component of production expenditures, were also affected by environmental regulations. Industry estimates that 12 percent of annual production costs were related to worker safety and 10 percent of total capital expenditures went toward pollution abatement.

The supply and the prices of aromatic petrochemicals such as toluene and xylene depend greatly on their use as octane improvers in gasoline, which consumes about 40 percent of the isolated toluene and 25 percent of the xylene. Government regulations requiring the reduction of lead alkyls in gasoline have increased the demand for aromatics, especially toluene for use in unleaded gasoline. About 30 percent of the supply of benzene is derived from the dealkylation of toluene; therefore, increased demand for toluene in the auto-fuel market will be reflected not only in the prices of benzene and toluene, but also in the prices of their derivatives. Recent industry estimates indicate that a proposed or current increase of 10 cents per gallon in the price of toluene will be reflected in the following price increases: benzene (15.8 percent); cumene (12.0 percent); phenol (10.6 percent); and styrene (8.2 percent).

Price changes

In 1978, average domestic prices of cyclic (benzenoid) intermediates were approximately 7 percent less than those in the peak year of 1977 (table A). Industry price quotations for some of the large-volume intermediates reflect considerable price erosion between January and December 1978. For example, phenol prices decreased from 27.5 cents per pound in January to 19 cents per pound in December and maleic anhydride dropped from 37 cents per pound in January to 27 cents per pound in December. However, styrene monomer was quoted at 21 cents per pound in January, 17.5 cents in July, and 20.5 cents in December. Sluggish markets for end use organic chemical products and excess capacity to produce the intermediates were the most frequent explanations given for the price declines. There were small increases in 1978, however, in the selling prices of detergent alkylate (dodecylbenzene), cyclohexane, and caprolactam monomer. Price increases for detergent alkylate reflected the national and worldwide shortage of one of its major raw materials, normal paraffins.¹ The cyclohexane price increase reflects the increased cost of benzene, from which it is made. The caprolactam monomer price increased 2.5 cents per pound beginning in October 1978. However, other large-volume intermediates such as phthalic anhydride, aniline, ortho and paradichlorobenzenes, and isophthalic acid experienced no price increases or decreases in 1978.

¹This shortage was due primarily to a rise in demand for detergents and a shutdown of a large normal paraffin plant in Italy.

Trends in U.S. Production, Sales, and Consumption, 1973-78

The trends in U.S. production, sales, and consumption of products from the cyclic intermediates industry, which manufactured 1,060 chemicals in 1978, are briefly described below.

Industry profile

In 1978 there were 162 companies which produced 46 billion pounds of cyclic intermediates. About 58 percent of this production was captive (consumed in plant by the producer in the manufacture of more advanced chemicals). Sales amounted to 19 billion pounds, valued at \$4.1 billion (table A and fig. 1).

Those cyclic intermediates used principally to make plastics and synthetic fibers are large-volume hydrocarbon petrochemicals, each produced by a large number of producers (from 8 to 14 each); however, in no instance is the bulk of the production controlled by a small number of companies. For those intermediates which are used to manufacture dyes, pigments, medicinals, pesticides, and so forth, the four largest producers accounted for less than 30 percent of the output.

Employment in the cyclic intermediates industry in 1978 amounted to 28,000, compared with 29,000 in the peak year 1977.

Although there is considerable double counting in the production data, i.e., one compound used in the manufacture of a second compound is reported again in its new structure, the gross value of such production in 1978 is estimated at \$10 billion. Eight percent of that production was exported.

In 1978, exports of cyclic intermediates were two times as large as imports, yielding a trade balance of \$383 million (table A and fig. 2). The increase in exports in 1978 over 1977 amounted to 22 percent and reflects the competitive advantage of U.S. exports in world markets because of the relatively lower cost of domestic feedstocks.

U.S. consumption

Domestic consumption of cyclic intermediates in 1978 amounted to \$9.6 billion. The ratio of imports to apparent consumption in 1978 was 4.2 percent, the same ratio as in 1973; during 1974-77 the ratio ranges from 3.4 to 4.0 percent. Apparent consumption increased from \$3.8 billion (measured in current dollars) in 1973 to \$9.6 billion in 1978, or at an average annual growth rate of 20.6 percent. Another approach to the measurement of consumption is obtained by using the quantity of the production, which increased during that period at an average annual rate of 4.9 percent.

Foreign Trade

In 1978, both imports of cyclic intermediates at \$407 million and exports of these chemicals at \$790 million were 22 percent more than in 1977. Industry sources attribute the large volume of exports to "improved economic conditions in some industrialized countries, greater demand for U.S. products in the oil-exporting nations, and the declining value of the U.S. dollar relative to several foreign currencies."¹

U.S. imports

Imports of industrial organic chemicals (cyclic intermediates) amounted to \$407 million in 1978, compared with \$334 million in 1977. From 1973 to 1978, imports grew from \$172 million to \$407 million in 1978, or by an average annual growth rate of 18.8 percent, measured in current dollars (table A and fig. 2).

The principal sources of U.S. imports of cyclic intermediates during 1973-78 were Western Europe (principally the European Community (EC)) and Asia (principally Japan). In 1978, 72 percent of U.S. imports came from the EC and 23 percent, from Asia.

There were 824 benzenoid (cyclic) intermediates imported in 1978, compared with 819 imported in 1977. During 1978, imports from member countries of the Organization for Economic Cooperation and Development accounted for 95 percent of the total value of imports of cyclic intermediates, with 5 percent coming from developing countries. The nine EC countries accounted for 61 percent of the total benzenoid intermediates and Japan, for 21 percent. Imports of cyclic intermediates from eligible Generalized Systems of Preference countries in 1978 were valued at \$5.5 million or 1 percent of the total.

In 1978, 76 percent of the imports of industrial organic chemicals were classified into 13 chemically functional groups; several individual chemicals were specified within these groups. About 80 percent of the compounds classified by function were in the following seven groups: amines having one or more oxygen functions; alcohols, phenols, ethers, and aldehydes; amines and their derivatives; sulfonamides; carboxylic acids; heterocyclic compounds; and nitrogen function compounds, not specifically provided for. In 1978, on the basis of an analysis of imports of benzenoid chemicals and products by the U.S. International Trade Commission, phthalic anhydride (40 million pounds) was the principal product imported. The principal sources of phthalic anhydride were Argentina, Canada, Italy, Venezuela, and the United Kingdom. Ethylbenzene (34 million pounds) was the second most important cyclic intermediate imported in 1978; it came from Canada and the Netherlands. Styrene monomer (31 million pounds) all came from Canada. Cyclohexane (10 million

¹Chemical and Engineering News, June 11, 1979 p. 62.

pounds) came from Argentina and West Germany. Other imports of lesser volume in 1978 included para-cresol, copper phthalocyanine crude, 1-chloro-2-nitrobenzene, adipic acid, caprolactam, o-nitrophenol, hexamethylenediamine, 2-naphthol (B-naphthol), (m,p)-cresol, o-anisidine, and maleic anhydride. Imports of these 15 intermediates accounted for approximately 54 percent of the total quantity of intermediates imported and analyzed by the Commission in 1978.

U.S. exports

Exports of industrial organic chemicals (principally cyclic intermediates) in 1977 accounted for 19 percent of total sales. Although U.S. exports of cyclic intermediates increased from \$345 million in 1973 to \$790 million in 1978, the ratio of exports to imports remained fairly steady, ranging from 1.9 in 1977 to 2.6 in 1974.

According to industry sources, the U.S. chemical industry's advantage in low feedstock costs enabled it to increase exports to Western Europe by 25 percent in 1978 over those in 1977, despite the overcapacity that existed in European chemical plants. Exports to developing country markets also registered large increases. Approximately 40 percent of U.S. exports go to Western Europe and approximately 35 percent go to countries in the Western Hemisphere, principally Latin American. About 20 percent of U.S. exports go to countries in Asia. In Europe, the principal market for cyclic intermediates is the EC, whereas in the Western Hemisphere the principal market is Latin America (table B and fig. 2).

Industrial organic chemical products exported in the largest amounts in 1978 were styrene monomer, cyclohexane, phenol, detergent alkylate (dodecylbenzene), dimethyl terephthalate, toluene diisocyanates, caprolactam monomer, polyalkylbenzenes, dichlorobenzene, isophthalic acid, maleic anhydride, and phthalic anhydride. Exports of these products in 1978 amounted to \$366 million and accounted for 46 percent of the total value of U.S. exports of industrial organic chemicals; principal markets were the Netherlands, Canada, Mexico, and Japan.

SYNTHETIC ORGANIC CHEMICALS, 1978

STATISTICAL HIGHLIGHTS

Daniel F. McCarthy and Bonnie Jean Noreen

Cyclic intermediates are synthetic organic chemicals derived principally from petroleum and natural gas and from coal-tar crudes produced by destructive distillation (pyrolysis) of coal. Most cyclic intermediates are used in the manufacture of more advanced synthetic organic chemicals and finished products, such as dyes, medicinal chemicals, elastomers (synthetic rubber), pesticides, and plastics and resin materials. Some intermediates, however, are sold as end products without further processing. For example, refined naphthalene may be used as a raw material in the manufacture of 2-naphthol or of other more advanced intermediates, or may be packaged and sold as a moth repellent or as a deodorant. In 1978 about 44 percent of the total output of cyclic intermediates was sold; the rest was consumed chiefly in the producing plants in the manufacture of more advanced intermediates and finished products.

Total production of cyclic intermediates in 1978 amounted to 19,936 million pounds, a 6 percent increase from the 18,726 million pounds produced in 1977. Sales of cyclic intermediates in 1978 were 8,853 million pounds, valued at \$2,803 million, compared with 7,986 million pounds, valued at \$2,597 million in 1977. These totals do not include the following cyclic intermediates: ethylbenzene, cyclohexane, cyclohexene, styrene, m-xylene, o-xylene, p-xylene, and cumene. Figures on U.S. production and sales of these eight cyclic intermediates are included in Section II, Primary Products from Petroleum and Natural Gas for Chemical Conversion.

Intermediates which were produced in excess of 2 billion pounds in 1978 were dimethyl terephthalate (5,954 million pounds), and phenol (2,682 million pounds). Other large-volume intermediates produced in 1978 were isocyanates (1,210 million pounds), cyclohexanone (1,162 million pounds), phthalic anhydride (978 million pounds), aniline (606 million pounds), nitrobenzene (576 million pounds), alkylbenzenes (526 million pounds), bisphenol A (471 million pounds), monochlorobenzene (295 million pounds), toluene-2,4-diamine (139 million pounds), nonylphenol (125 million pounds), and melamine (112 million pounds). The 13 chemicals noted above accounted for 74 percent of the total output of intermediates in 1978.

TABLE I.--CYCLIC INTERMEDIATES: U.S. PRODUCTION AND SALES, 1978

[Listed below are all cyclic intermediates for which any reported data on production and sales may be published. (Leaders (...)) are used where the reported data are accepted in confidence and may not be published or where no data were reported.) Table 2 lists all cyclic intermediates for which data on production and/or sales were reported and identifies the manufacturers of each]

¹Calculated from unrounded figures.

²Includes straight-chain dodecylbenzene, tridecylbenzene, and other straight-chain alkylbenzenes. Branched-chain alkylbenzenes are included in "All other cyclic intermediates."

³Does not include data for coke ovens and gas-retort ovens, reported to the Office of Energy Data and Interpretation, Energy Information Administration, Department of Energy.

⁴Figures include (o,m,p)-cresol from coal tar and some m-cresol and p-cresol.

⁵The figures for terephthalic acid, dimethyl ester (DMT) include both the acid itself and the dimethyl ester without double counting. The acid production figure was multiplied by the factor 1.16 to convert it to equivalent DMT.

STATISTICAL HIGHLIGHTS

Edmund Cappuccilli

Synthetic dyes are derived in whole or in part from cyclic intermediates. Approximately two-thirds of the dyes consumed in the United States are used by the textile industry to dye natural and synthetic fibers or fabrics; about one-sixth is used for coloring paper; and the rest is used chiefly in the production of organic pigments and in the dyeing of leather and plastics. Of the several thousand different synthetic dyes that are known, more than one thousand are manufactured by one or more domestic producers. The large number of dyes results from the many different types of materials to which dyes are applied, the different conditions of service for which dyes are required, and the costs that a particular use can bear. Dyes are sold as pastes, powders, lumps, and solutions; concentrations vary from 6 percent to 100 percent. The concentration, form, and purity of a dye are determined largely by the use for which it is intended.

Total domestic production of dyes in 1978 amounted to 251 million pounds, or 5.1 percent less than the 264 million pounds produced in 1977 (table 1). Sales of dyes in 1978 amounted to 233 million pounds, valued at \$734 million, compared with 255 million pounds, valued at \$690 million, in 1977. In terms of quantity, sales of dyes in 1978 were 8.6 percent less than in 1977 and in terms of value, 6.3 percent greater. The average unit value of sales of all dyes in 1978 was \$3.15 per pound compared with \$2.71 per pound in 1977.

The production of five classes of dyes continued to increase in 1977, while the remaining four major classes registered slight to large declines (vat dyes) in their production. Acid dyes increased by 28.4 percent from 30.7 million pounds in 1977 to 39.4 million in 1978. The other four classes of dyes increased by the following percentages: disperse dyes (2.5), fiber-reactive dyes (7.1), food, drug, and cosmetic colors (6.6), and solvent dyes (6.9).

PROFILE OF THE DOMESTIC ORGANIC PIGMENTS INDUSTRY

Bonnie Jean Noreen

In 1978, U.S. production, sales, apparent consumption, and foreign trade in synthetic organic pigments continued the upward trend from the economic setback of 1974-75. The United States enjoys a positive balance of trade in the organic pigments; exports in 1978 were 2.5 times greater than imports on the basis of quantity and 1.4 times greater on the basis of value.

All the organic pigments reported here are benzenoid products, i.e., they have a chemical structure like or similar to that of a benzene or modified benzene ring.

Description and Uses

Organic pigments comprise approximately 10 percent of the total volume and 30 percent of the total value of all pigments. Although more expensive than their inorganic counterparts, they are available in brighter and more varied colors. Organic pigments are usually transparent and can be dissolved by organic solvents while inorganic pigments are usually opaque and insoluble in such solvents. The volume of organic pigments as a percent of the total pigments output is not expected to change significantly, but their percent of the value is expected to increase in the next several years partly because of the increased costs of the petrochemical raw materials.

Organic pigments can be derived from synthetic or natural dyestuffs. For economic reasons, the natural products have been almost completely replaced by synthetics. These pigments are generally derived from dyes or pigment intermediates closely related to dyes. Color lakes are prepared by the precipitation of a water-soluble dye on an insoluble inorganic compound or substrate. In contrast, toners, or full-strength colors, do not require a substrate or base. Toners are by far the more commercially important of the two pigments and are marketed either full-strength or extended, i.e., diluted by the addition of a solid diluent.¹

The largest use of organic pigments is in printing inks. The second largest use is in paints and other coatings. Lesser amounts are employed to color plastics, textiles, and many other products. When used in inks and paints, pigments must be readily dispersible in such mediums as oils, organic solvents, varnishes, and resins.

¹Although extended toners are provided for under TSUS item 406.70, analysis of import data indicates that imports have also been entered under TSUS item 409.00 as mixtures.

The Domestic Industry

The number of companies reporting production and/or sales of organic pigments in 1978 was 37--one more than in 1977. Concentration in the industry in 1978 was similar to the previous year. In both years, 5 of the reporting companies accounted for 59 percent of the total sales value; in 1978, 10 companies accounted for 82 percent of total sales value compared with 83 percent in 1977.

For the third consecutive year both production and sales of organic pigments has increased. In 1978, the production of organic pigments was 76.7 million pounds, which represents an increase of 7.0 million pounds (10.0 percent) more than the 69.7¹ million pounds produced in 1977. The sales quantity in 1978 increased by 7.2 million pounds (12.5 percent) and sales value increased by \$54.1 million (20.2 percent) more than the previous year. In 1978 both production and sales quantities exceeded the previous highs recorded before the economic setback of 1974-75. The sales unit value in 1978 was \$4.98 per pound, \$0.32 per pound (6.9 percent) higher than the previous year and \$0.17 per pound (3.5 percent) higher than the unit value set in 1976, the next highest year (table A).

Over the past 10 years, toners have increasingly become more important than lakes. In 1978, toner production was 75.3 million pounds, which was 55 times as great as the 1.4 million pounds of lakes produced. Ten years earlier, in 1969, the 57.3 million pounds of toners produced were only 15 times as great as the 3.7 million pounds of lakes produced that year. Sales of toners in 1978 were 63.7 million pounds valued at \$318.9 million; this is 69 times as great as lakes on the basis of quantity, and 105 times as great as lakes on the basis of value. Over the past 10 years, production of lakes has decreased by 63 percent while production of toners has increased by 31 percent. The sales unit values of both have increased in the past 10 years, toners by 83 percent (from \$2.73 to \$5.00 per pound), and lakes by 193 percent (from \$1.12 to \$3.28 per pound) (table A).

The apparent U.S. consumption of organic pigments in 1978 was 64.7 million pounds, representing a 3.3 percent increase over the 62.6 million pounds apparently consumed in 1977. Apparent U.S. consumption, like production, has been increasing since the economic setback of 1974-75.

In 1978, foreign companies continued to purchase domestic organic pigments firms. In early 1978 the pigments division of GAF was bought by BASF Wyandotte. The proposed sale of the pigments division of Allegheny Ludlum Industries, Inc. (formerly the pigments division of Chemetron Corp.) to Bayer A.G. was withdrawn during an antitrust investigation by the U.S. Federal Trade Commission. The company was eventually purchased in early 1979 by BASF Wyandotte. Seven of the 37 companies reporting production and/or sales of organic pigments in 1978 were German or Swiss subsidiaries. (The sale of the pigments division of Allegheny Ludlum is not included in this report, since the sale of that division was not completed until 1979.)

¹Revised figure for 1977.

Industry Outlook

The effect that the elimination of the American selling price and other negotiations of the Tokyo round will have on the domestic organic pigment industry is uncertain. At the present time, the ad valorem equivalent duty rates range from 20 to 31.3 percent of transaction values. The new rates negotiated in the recent multilateral trade negotiations will range from 8.3 to 20 percent ad valorem. Little immediate effect is anticipated from the negotiated lower rates of duty on imports of synthetic organic pigments; these imports in 1978 accounted for about one-eighth of the domestic market.

Environmental Protection Agency regulations continue to have an effect on the domestic pigment industry. The registration and testing of new pigments under the Toxic Substances Control Act, and solid waste control, are perhaps two of the more unexplored areas at present. The increased testing required for all pigments may prove to be beneficial to the organic pigment industry because the pigments suspected of being carcinogenic are more heavily concentrated among the inorganic pigments and Government control of these pigments (such as some chromium and cadmium compounds) could lead to broader use of their organic counterparts.

In the foreseeable future, the cost of raw materials and energy for the organic pigments industry is expected to continue to rise because of international pressure on oil prices and changes in the U.S. Government price controls on oil and gas. Ultimately, any significant increases in petroleum prices will probably be passed on to the consumer. The unit value dip of 1977 is not expected to repeat itself in the immediate future, and the average unit value for pigments in 1979 will probably exceed \$5.00 per pound.

Foreign Trade

U.S. exports of organic pigments in 1978 registered an increase for the third consecutive year in both quantity and value. The total quantity of exports, 20.0 million pounds, was 5.2 million pounds (35.5 percent) greater than the quantity exported in 1977. The total value of exports in 1978 was \$56.4 million, an increase of \$16.2 million (40.2 percent) more than the \$40.3 million recorded in 1977. Canada, Japan, the United Kingdom, Belgium, West Germany, Italy, the Netherlands, Mexico, France, Venezuela, and Australia made up 69 percent of the quantity and 75 percent of the value of these exports (table C).

U.S. imports of organic pigments in 1978 also registered an increase for the third consecutive year in both quantity and value, but the quantity was still 210,000 pounds less than the alltime high reached in 1974. The total quantity of imports, 7.9 million pounds, was 0.3 million pounds greater than

it was in 1977, representing an increase of 3.8 percent. The total value of imports in 1978 was \$41.7 million, an increase of \$5.3 million (14.5 percent) more than the \$36.4 million recorded in 1977. U.S. imports of organic pigments are primarily from West Germany and Switzerland. In 1978 these two countries accounted for 61.0 percent of the quantity and 74.5 percent of the value of these imports (table D). Data on annual imports of benzenoid chemicals are examined by the U.S. International Trade Commission. In 1978 the Commission examined 62 percent of the total quantity reported in the official statistics of the U.S. Department of Commerce.

Imports of Pigments Blue 15 (α form), Red 144, Yellow 93, Red 57:1, Green 36, and Yellow 73 accounted for 41 percent on the basis of quantity of the total U.S. organic pigments imports examined by the Commission in 1978.¹ Imports of organic pigments in 1978 accounted for 12.3 percent of apparent U.S. consumption on the basis of quantity and 11.4 percent on the basis of value (table B).

The United States has had a positive trade balance in organic pigments for the past several years. In 1978, exports exceeded imports by 12.0 million pounds on the basis of quantity and \$14.7 million on the basis of value. U. S. exports of organic pigments are, on the average, of lower unit value than imports. In 1978, imports of organic pigments averaged \$5.26 per pound whereas exports averaged only \$2.82 per pound.

STATISTICAL HIGHLIGHTS

Bonnie Jean Noreen

Organic pigments are toners and lakes derived in whole or in part from benzenoid chemicals and colors.

Statistics on production and sales of all organic pigments in 1978 are given in table 1.¹ For a few important pigments already reported in table 1, supplemental data on sales by commercial forms are reported in table 1A. Individual toners and lakes are identified in this report by the names used in the third edition of the Colour Index.

Total production of organic pigments in 1978 was 76.7 million pounds--10.0 percent more than the 69.7² million pounds produced in 1977. Total sales of organic pigments in 1978 amounted to 64.6 million pounds, valued at \$321.9 million compared with 57.4 million pounds, valued at \$267.7 million, in 1977. In terms of quantity, sales of organic pigments in 1978 were 12.5 percent greater than in 1977; in terms of value, sales in 1978 were 20.2 percent greater than in 1977.

Production of toners in 1978 amounted to 75.3 million pounds--10.6 percent more than the 68.1² million pounds reported in 1977. Sales in 1978 were 63.7 million pounds, valued at \$318.9 million, compared with 56.0 million pounds, valued at \$263.7 million, in 1977. Sales in 1978 were 13.7 percent greater than those of 1977 in terms of quantity, and 20.9 percent greater in terms of value. The individual toners listed in the report which were produced in the largest quantities in 1978 were Pigment Yellow 12, 11.9 million pounds; Pigment Blue 15:3, beta form, 7.3 million pounds; Pigment Red 49:1, barium toner, 5.6 million pounds; Pigment Red 53:1, barium toner, 3.9 million pounds; Pigment Red 57:1, calcium toner, 3.4 million pounds; and Pigment Blue 15, alpha form, 3.3 million pounds.

Production of lakes totaled 1.4 million pounds in 1978--13.0 percent less than the 1.6 million pounds reported for 1977. Sales of lakes in 1978 amounted to 0.9 million pounds, valued at \$3.0 million. In terms of quantity, sales of lakes in 1978 were 33.9 percent less than in 1977; in terms of value, sales in 1978 were 25.7 percent greater than in 1977.

For each of 10 selected pigments, or groups of pigments, table 1A gives data on sales by commercial forms. Pigment Yellow 14, all other diarylide yellows (with the exceptions of Pigments Yellow 12 & 14), Pigment Red 3, Pigment Red 48:2, calcium, Pigment Blue 15, alpha form and Pigment Green 7 were sold principally in the dry full-strength form. The remaining 4 pigments for which statistics are published were sold principally in the flushed form.

¹See also table 2 which lists these products and identifies the manufacturers by codes. These codes are listed in table 3.

²Revised figures for 1977.

¹The value of sales from toners are reported on a dry full-strength basis and the value of sales for lakes are reported on a dry form basis. All sales value data exclude the additional costs of processing or packaging in commercial forms other than the dry full-strength or dry form.

²Calculated from unrounded figures, except "All other."

³Quantities for toners are reported as dry-full strength toner content, excluding the weight of any dispersing agent, vehicle, or extender. Quantities for lakes are reported as dry lake content, excluding the weight of any dispersing agent or vehicle.

⁴Incorrectly reported in 1977 report--should have been 1 million pounds greater than reported.

Note.--The C.I. (Colour Index) numbers shown in this report are the identifying numbers given in the third edition of the Colour Index.

The abbreviations PMA and PTA stand for phosphomolybdic and phosphotungstic (including phosphotungstomolybdic) acids, respectively.

²Calculated from unrounded figures.

³Quantity of the various commercial forms is given in terms of dry full-strength toner content.

⁴Includes presscake.

⁵Separate data on these commercial forms may not be published without revealing the operation of individual companies.

Note.--The C.I. (*Colour Index*) numbers shown in this report are the identifying numbers given in the third edition of the *Colour Index*.

The abbreviations PMA and PTA stand for phosphomolybdic and phosphotungstic (including phosphotungstomolybdic) acids respectively.

IMPORTANT DEVELOPMENTS IN MEDICINAL CHEMICALS IN 1978,
AND A CASE STUDY OF THE PENICILLINS

Tedford C. Briggs

The principal developments involving medicinal chemicals in 1978 were mostly the result of U.S. Government actions. For example, the Drug Regulatory Reform Act was debated during 1978 but was not enacted. The Food and Drug Administration (FDA) delayed plans to place restrictions on the use of penicillins and tetracyclines in animal feeds. The FDA proposed labeling changes and other regulatory changes to warn of hazards associated with the use of certain drugs.

Several new drugs were introduced in 1978; their therapeutic properties are summarized below. The penicillins are examined below in detail because they were the next major class of anti-infective agents developed after the anti-infective sulfonamides, which were discussed in the 1977 SOC report.

Government Actions

After lengthy subcommittee hearings in both the House and Senate the proposed Drug Regulatory Reform Act of 1978 failed to be enacted in the 95th Congress. The same legislation has, however, been reintroduced in the 96th Congress.

The basic thrust of the proposed legislation is to accelerate the introduction into the market of valuable new drugs, while at the same time insuring that excessively toxic or dangerous drugs will be removed from the market. The drug industry reportedly supports features of the legislation that would speed up the introduction of new drugs, but opposes provisions that would make public the safety and efficacy data that companies in the industry feel could disclose trade secrets to their competitors. On the other hand, industry critics want access to the data so that they can ferret out any industry deceptions in the drug approval process. This difference of opinion about safety and efficacy data disclosure is, therefore, the central issue in the continuing debate on the merits of the drug reform legislation.

On July 14, 1978, the House Agriculture Committee unanimously approved a resolution urging the FDA to await completion of scientific studies before making a final decision on proposed regulations that would curtail the use of penicillins and tetracyclines as animal feed additives. The FDA regulations were proposed because of the fear that bacterial drug resistance developed in animals receiving treated feeds could be transferred to other animals or humans, thus reducing the effectiveness of the drugs involved in treating human disease. The resolution called on the FDA to delay action until completion of studies being conducted by the National Academy of Sciences, the Congressional Office of Technology Assessment, and the U.S. Department of Agriculture. It stated that

antibiotics have been used at low levels in feeds for about 30 years without proof that human health has been adversely affected. At the same time, the resolution stated, the treated feeds have promoted faster and healthier growth of mass-fed animals and have reduced the cost of producing food.

Subsequently, the FDA postponed implementation of the proposed regulations, reportedly because of procedural questions that were raised during public hearings and because of concern about whether there was a sufficient number of veterinarians to have handled the workload that would have been imposed by the regulations. There was no indication that it had changed its views about the possible long-term adverse effects of antibiotics in animal feeds.

In other actions the FDA, along with the National Bureau of Standards and the Joint Commission on Prescription Drug Use, took the first steps to develop an improved system for monitoring unexpected side effects from newly approved drugs. The FDA says that if useful new drugs are to be approved quickly, a postmarketing drug-monitoring system is needed for removing drugs from the market if they are found to be dangerous.

The FDA implemented requirements in labeling of birth control pills to warn that, in women using birth control pills, cigarette smoking greatly increases the risk of heart attacks, strokes, and other cardiovascular disorders. Five independent studies agree on the hazardous association between the use of birth control pills and smoking.

The FDA took a number of steps toward banning certain hormone-based animal health products that have been used to stimulate growth in livestock and poultry. Products that would be affected by the proposed ban include those containing estradiol, progesterone, or testosterone.

An advisory panel to the FDA recommended restrictions on the labeling of vitamin and mineral products sold as over-the-counter drugs. The panel recommended that labeling should be restricted to promotion of the products only for the treatment of physician-identified deficiencies. Also, the panel recommended restrictions on the use of the term "natural" in the labeling as there is no evidence that so-called natural forms of vitamins and minerals are better than synthetic ones.

New Drugs in 1978

Each year many new drugs are developed and tested by chemical and pharmaceutical manufacturers. Some of these drugs eventually gain FDA approval and reach the marketing stage. The following list of new drugs,

although not a comprehensive list, covers new treatments for a wide range of diseases.

Tamoxifen--was approved for sale and distribution in the United States as an antiestrogen drug for palliative treatment of advanced breast cancer in women. The drug is said to have fewer serious side effects than other anticancer drugs.

Urokinase--was approved for treatment of massive pulmonary embolism; i.e., it works by dissolving blood clots that cause pulmonary embolism. Urokinase is an enzyme produced by the kidneys and normally found in minute quantities in urine. The drug can be obtained by extraction from urine or produced from human kidney cells grown in tissue culture.

Metoprolol tartrate--was approved for treatment of high blood pressure. The exact way in which the drug acts in controlling high blood pressure is unknown.

Trimolol maleate--was approved for use in lowering the high internal eye pressure of glaucoma. Trimolol maleate is the first of the beta-adrenergic blocking agents to be approved for treatment of glaucoma.

Vidarabine--was approved for the treatment of herpes simplex encephalitis. This disease is a life-threatening inflammation of the brain caused by a herpes virus. Test data indicate that treatment with vidarabine can significantly reduce the fatalities and neurological damage caused by this disease.

Cefoxitin, sodium--was approved for use against a wide range of serious infections, including some that are resistant to other antibiotics.

Natamycin--was approved for treatment of a fungal infection of the eye that can cause blindness. Because of the small number of people affected, natamycin has little commercial potential, but it is expected to be vitally important to those individuals who suffer from fungal keratitis.

Butorphanol tartrate--was approved for the relief of moderate-to-severe pain. Unlike many other potent prescription pain relievers, butorphanol tartrate is not classified as a narcotic. Advantages claimed for this analgesic are low addictive potential and limited respiratory depressant effects.

Penicillins

The penicillins are a highly important group of anti-infective agents which were developed a few years after another class of anti-infective agents known as sulfonamides.

Discovery and development

Penicillin was discovered by Alexander Fleming, professor of bacteriology, at Saint Mary's Hospital, London. In 1929, a spore of the mold Penicillium notatum lodged in a culture dish which harbored pathogenic staphylococcus bacteria. It soon became apparent to Professor Fleming that the penicillin mold was inhibiting growth of the staphylococci, and he was quick to grasp the significance of this discovery. However, it was not until 1939 that a group at Oxford University under the leadership of H. W. Florey prepared a sufficient quantity of material for clinical tests, which were encouraging enough to warrant further work. England was under siege at that time, and Professor Florey moved to the United States to continue development work on penicillin at the Northern Regional Research Laboratory (NRRL), Bureau of Agricultural and Industrial Chemistry, U.S. Department of Agriculture. That laboratory was selected because of the extensive experience of the NRRL staff in mold fermentations.

When sufficient quantities of penicillin were prepared, a clinical testing program was organized and, by 1943, the combined efforts of the many people involved in the penicillin program had established the medicinal value of penicillin.

Once the therapeutic value of penicillin had been established and laboratory production methods developed, large-scale production became the next formidable problem. The problem was referred to the War Production Board, which made decisions as to the required number of plants, plant capacity, allocation of supplies, and so forth. By 1944, 21 plants were producing penicillin in the United States at a rate of approximately 200 billion units of penicillin per month.

The technical knowledge and skills accumulated during the early years of penicillin development led directly to the discovery and production of many valuable antibiotics other than the penicillins.

There are six naturally occurring penicillins, but of these only penicillin G has found wide application as an anti-infective agent. A. J. Moyer and R. D. Coghill discovered in 1947 that the addition of phenylacetic acid to the fermentation media increased the yield of penicillin G. This discovery prompted research into the addition of other chemicals to the penicillin fermentation media, which resulted in a "second generation" of biosynthetic penicillins. About 40 or 50 compounds of this type were developed, but only a few had any advantage over penicillin G.

The most important of the biosynthetic derivatives is penicillin V, which is obtained by adding phenoxyacetic acid or phenoxyethanol to the fermentation media. This penicillin is relatively acid stable, and hence can be administered in oral doses without destruction of the penicillin by the acid content of the stomach.

The "third generation" penicillins are chemical derivatives or modifications of 6-aminopenicillanic acid. Literally thousands of semisynthetic penicillins have been made, and many of them possess desirable properties such as stability toward acids and resistance to the enzyme produced by some bacteria that destroys most penicillins. The semisynthetic penicillins are used to treat a wide range of bacterial infections.

Manufacture of penicillins

There are many technical problems associated with the commercial production of penicillin, and it was a major advancement in fermentation technology when substantial quantities of penicillin were first made. Since many organisms produce an enzyme which destroys penicillins, penicillin fermentation must be conducted under aseptic conditions. Maintaining aseptic conditions during industrial-scale fermentation processes is, at best, difficult. Since the penicillin-producing organisms are aerobic, submerged-culture techniques were developed to supply oxygen to the mold. Batch processes are used, in most instances, in which the fermentor is filled with culture medium, sterilized, cooled, then inoculated with penicillin culture. Fermentation is then allowed to proceed until the penicillin concentration reaches a maximum, at which time the batch is harvested and the procedure repeated.

Considerable work has been done to develop strains of the penicillin microorganisms that produce the maximum amount of penicillin during the fermentation process. Strain development has been enhanced by the use of radiation, neutron bombardment, heat, and chemical agents. Once a high-producing strain has been developed it can be maintained and propagated for months or even years. Inoculum from the strain is then used in successive fermentation batches to produce penicillin.

Statistical measurement problems associated with the penicillins

Early in the development of the penicillin industry, problems arose in determining the amount of penicillin in the fermentation mixtures and in the final products and, as a result, an arbitrary standard unit of measurement based on a quantity of penicillin G was adopted. The testing methods have changed over the years so that test results are now more reproducible. However, the antibiotic activity of penicillin is still measured in arbitrary units and varies according to the type of penicillin measured.

Data on production, imports, and exports of the penicillins have been reported in various units, i.e., international units, grams, and pounds; data are also reported without a unit of quantity. Thus, when statistics are given for various groups of penicillins (as is usually the case), the data cannot be translated to another measurement of quantity or used to

track the growth of consumption or trade over a period of years. For these reasons, a historical presentation of penicillin trade data is not included here.

U.S. International Trade in Bulk Medicinals, 1973-78

U.S. production of bulk medicinals increased 15 percent during 1973-78. Sales quantity increased only 3.4 percent, but sales value increased 62 percent, to \$944 million. Domestic employment increased 72 percent, from 8,200 to 14,200 (see the following table).

The value of U.S. exports increased 86 percent, from \$311 million in 1973 to \$580 million in 1978. The value of U.S. imports increased threefold, from \$43 million in 1973 to \$172 million in 1978.

The Producer Price Index increased 37 percent.

STATISTICAL HIGHLIGHTS

Tedford C. Briggs

Medicinal chemicals include the medicinal and feed grades of all organic chemicals having therapeutic value, whether obtained by chemical synthesis, by fermentation, by extraction from naturally occurring plant or animal substances, or by refining a technical grade product. They include antibiotics and other anti-infective agents, antihistamines, autonomic drugs, cardiovascular agents, central nervous system depressants and stimulants, hormones and synthetic substitutes, vitamins, and other therapeutic agents for human or veterinary use and for animal feed supplements.

The table shows statistics for production and sales of medicinal chemicals grouped by pharmacological class. The statistics shown are for bulk chemicals only. Finished pharmaceutical preparations and products put up in pills, capsules, tablets, or other measured doses are excluded.¹ The difference between production and sales reflects inventory changes, processing losses, and captive consumption of medicinal chemicals processed into ethical and proprietary pharmaceutical products by the primary manufacturer. In some instances, the difference may also include quantities of medicinal grade products used as intermediates, for example, penicillin G salts used as intermediates in the manufacture of semi-synthetic penicillins. All quantities are given in terms of 100-percent content of the pure bulk drug.

Total U.S. production of bulk medicinal chemicals in 1978 amounted to 269.1 million pounds, or 11.8 percent more than the 240.7 million pounds produced in 1977 and 14.1 percent more than the 235.8 million pounds produced in 1976. Total sales of bulk medicinal chemicals in 1978 amounted to 185.1 million pounds, valued at \$944.1 million, compared with sales in 1977 of 162.4 million pounds, valued at \$794.0 million, and sales in 1976 of 160.8 million pounds, valued at \$741.5 million. In terms of quantity, sales in 1978 were 14.0 percent more than in 1977 and 15.1 percent more than in 1976. In terms of value, sales in 1978 were 18.9 percent more than in 1977 and 27.3 percent more than in 1976.

Production of the more important groups of medicinal chemicals in 1978 was as follows: Antibiotics, 25.7 million pounds (11.2 percent more than in 1977), of which 13.4 million pounds was for medicinal use and 12.3 million pounds was

¹Complementary statistics on the dollar value of manufacturers' shipments of finished pharmaceutical preparations, except biologicals, are published annually by the U.S. Department of Commerce, Bureau of the Census, in Current Industrial Reports, Series MA-28G. Many pharmaceutical manufacturers who report to the Bureau of the Census are excluded from the U.S. International Trade Commission report because they are not primary producers of medicinal chemicals, that is, they do not themselves produce the bulk drugs which go into their pharmaceutical products but purchase their drug requirements from domestic or foreign producers.

for other uses; anti-infective agents other than antibiotics, 28.6 million pounds (2.3 percent more than in 1977); central nervous system depressants and stimulants, 49.3 million pounds (6.1 percent less); and vitamins, 37.8 million pounds (1.8 percent more).

Production of some of the more important individual products listed in the table was as follows: Methionine and its salts, choline chloride, 50.7 million pounds (5.3 percent larger than in 1977); aspirin, 32.2 million pounds (2.6 percent more); Penicillins (except semi-synthetic), 7.7 million pounds (3.5 percent more); tetracyclines, 5.9 million pounds (5.3 percent more); and vitamin E, 5.8 million pounds (10.4 percent more).

¹The data on production and sales are for bulk medicinal chemicals only.

²Calculated from rounded figures.

³Benzenoid, as used in this report, describes any cyclic medicinal chemical whose molecule contains either a six-membered carbocyclic ring with conjugated double bonds or a six-membered heterocyclic ring with 1 or 2 hetero atoms and conjugated double bonds, except the pyrimidine ring.

⁴Includes antibiotics of unknown structure.

⁵Production of all antibiotics for medicinal use amounted to 13,390,000 pounds, and sales amounted to 3,763,000 pounds, valued at \$206,915,000. Production of all antibiotics for animal feed and other nonmedicinal uses amounted to 12,315,000 pounds, and sales amounted to 5,407,000 pounds, valued at \$96,678,000.

⁶Includes sales quantity and value of amoxicillin and ampicillin.

⁷Includes sales quantity and value of penicillin V.

⁸Includes production and sales of antifungal, antitubercular, cephalosporin, and antibiotics.

⁹Includes sales quantity and value of antinauseants and chlorpheniramine maleate.

¹⁰Includes sales quantity and value of arsenic and bismuth compounds.

¹¹Includes sales quantity and value of acetaminophen and aspirin.

¹²Includes sales quantity and value of antidepressants and tranquilizers. Also includes production and sales of amphetamines, general anesthetics, and respiratory and cerebral stimulants.

¹³Includes sales quantity and value of synthetic hypoglycemic agents.

¹⁴Includes sales quantity and value of theophylline derivatives.

¹⁵Includes production and sales of vitamin A, vitamin B, vitamin C, and vitamin K.

¹⁶Includes production and sales of antineoplastic agents, cardiovascular agents, diagnostic agents, hematological agents (except sodium heparin), therapeutic nutrients, smooth muscle relaxants, and unclassified medicinal chemicals.

STATISTICAL HIGHLIGHTS

Cynthia B. Foreso

Flavor and perfume materials are organic chemicals used to impart flavors and aromas to foods, beverages, cosmetics, and soaps. These aroma chemicals are also utilized to neutralize or mask unpleasant odors in industrial processes and products as well as in consumer products.

Total domestic production of flavor and perfume materials in 1978 amounted to 189.4 million pounds (table 1). Sales of these materials in 1978 amounted to 140.2 million pounds, valued at \$211.8 million, compared with 107.6 million pounds, valued at \$207.1 million, in 1977. These totals do not include benzyl alcohol, which, before 1973, was included in flavor and perfume materials but is now shown in the miscellaneous cyclic section of this series. U.S. production of flavor and perfume materials in 1978 increased 26 percent from the level in 1977; while the quantity of sales increased by 30 percent.

Production of cyclic flavor and perfume materials in 1978 amounted to 101.2 million pounds; sales amounted to 83.6 million pounds, valued at \$137.2 million. Individual publishable chemicals in the cyclic group produced in the greatest volume in 1978 were α -terpineol, anethole, and benzyl acetate.

U.S. output of acyclic flavor and perfume materials in 1978 amounted to 88.3 million pounds; sales of these materials amounted to 56.7 million pounds, valued at \$74.6 million. Monosodium glutamate was by far the most important of the acyclic chemicals in 1978, although the data are not publishable. Other important acyclic compounds included linalyl alcohol, citronellol, and linalyl acetate.

STATISTICAL HIGHLIGHTS

Edward J. Taylor

Plastics and resin materials are high molecular weight polymers which, at some stage in their manufacture, exist in such physical condition that they can be shaped or otherwise processed by the application of heat and pressure. The terms "plastics," "resin," and "polymers," can be (and often are) used interchangeably by the trade. Depending on the chemical composition, manufacturing process or intended use, the commercial products may contain plasticizers, fillers, extenders, stabilizers, coloring agents, or other additives. There are about 40 to 50 basic plastics and resins which are available commercially. These basic materials are available in literally thousands of individual compounds each with its distinct properties depending on the molecular weight of the resin and the types and amounts of the additives present. Plastics materials may be molded, cast, or extruded into semi-finished or finished solid forms. Resin materials may be in the form of solutions, pastes, or emulsions for applications such as protective coatings, adhesives, or paper and textile treatment.

Statistics on U.S. production and sales of synthetic plastics and resin materials for 1978 are given in table 1. U.S. production of plastics and resin materials in 1978 totaled 38,878 million pounds, or 12.3 percent more than the 34,623 million pounds produced in 1977. Sales in 1978 totaled 33,527 million pounds, valued at \$12,349 million compared with 29,799 million pounds, valued at \$10,882 million in 1977.

Thermosetting materials are those which harden with a change in composition in the final treatment so that in their final state as finished articles they are substantially infusible and insoluble, that is, they cannot again be softened by heat or solvents. U.S. production of thermosetting materials totaled 7,906 million pounds in 1978 compared with 7,129 million pounds in 1977. Production of the most important products in 1978 included phenolic resins (1,926 million pounds), amino (or urea and melamine) resins (1,604 million pounds), polyester resins, (unsaturated) (1,133 million pounds) and alkyd resins (754 million pounds).

Thermoplastic materials are those which in their final states as finished articles can be repeatedly softened by heat and hardened by a decrease in temperature. U.S. production of thermoplastic materials totaled 30,972 million pounds in 1978 compared with 27,494 million pounds in 1977. Production of the most important products in 1978 included polyethylene (11,359 million pounds), vinyl resins (7,060 million pounds), and styrene type materials (5,989 million pounds).

TABLE 1.--PLASTICS AND RESIN MATERIALS: U.S. PRODUCTION AND SALES, 1978

[Quantities and values are given in terms of the total weight of the materials (dry basis). Listed below are all plastics and resin materials, urethane type elastomers, and certain precursors for which any reported data on production or sales may be published. (Leaders (...) are used where the reported data are accepted in confidence and may not be published or where no data were reported.) Table 2 lists all products for which data on production and/or sales were reported and identifies the manufacturers of each]

All other thermoplastics resins ¹⁹	169,139	882,788	692,983	.78

¹Calculated from unrounded figures.

²Dry weight basis unless otherwise specified. Dry weight basis is the total weight of the materials including resin and coloring agents, extenders, fillers, plasticizers, and other additives, but excluding water and other liquid diluents unless they are an integral part of the materials.

³Includes benzenoid plastics and resin materials as defined in part 1 of schedule 4 of the Tariff Schedules of the United States; also includes urethane type elastomers which are not defined in part 1 of schedule 4 of the TSUS.

⁴Includes data for other copolymers alkyls (production only).

⁵Includes reactive diluents which are an integral part of the resin. Excludes the weight of hardeners sold in association with the resin as part of a two-component system.

⁶Data shown for advanced epoxy resins are that part of the unmodified epoxy resins which is further processed; therefore, the totals in parentheses are not included in the grand total.

⁷Polyester resins are unsaturated alkyl resins, later to be copolymerized with a monomer (such as styrene or methyl methacrylate), and polyallyl resins (such as diallyl phthalate and diglycol carbonate). Data are on an "as sold" basis, including monomer if part of the resin system.

⁸In addition to the polyols, the other principal starting materials used in the production of urethane products are the isocyanic acid derivatives, mainly the 80/20 mixture of toluene-2,4- and 2,6-diisocyanate. Statistics for the isocyanic acid derivatives are reported in the "Cyclic Intermediated" section of the Synthetic Organic Chemicals report.

⁹The data on urethane elastomers are believed to be not fully representative of the total urethane market in view of the very large number of urethane elastomer producers.

¹⁰Includes acetone-formaldehyde resins, glyoxal-formaldehyde resins, polybutadiene resins and certain other thermosetting resins.

¹¹Does not include production or sales for fiber use.

¹²Engineering plastics: Includes acetal, polycarbonate, polyimide and amide-imide polymers, polysulfone, and polyphenylene oxide, and polyphenylene sulfide. Engineering plastics are defined in Whittington's Dictionary of Plastics, as "Those [plastics] which have mechanical, chemical and thermal properties suitable for use in construction, machine components and chemical processing equipment." The above list of plastics (all of which are thermoplastic) was selected from a larger group in this source. The other plastics named in Whittington's Dictionary as engineering plastics, ABS resins and nylon resins, are not included in the above list as they are published separately.

Footnotes--Continued

¹³Statistics for nylon 6 and nylon 6/6 which are used in plastic applications (e.g., molding, etc.) are included here.

¹⁴Statistics are included here for polyethylene terephthalate used in plastics applications (e.g., molding, etc.). Statistics also are included here for production only when the starting materials are converted directly to a finished product (i.e., "in-situ" production), polyester film and tape are examples of such a conversion.

¹⁵Includes data for styrene-acrylonitrile copolymer (SAN) resins, α -methyl styrene polymers, methyl methacrylate-butadiene-styrene (MBS) resins, and all other styrene copolymers.

¹⁶Data are on the basis of dry resin content, excluding the weight of plasticizers, extenders, fillers, coloring agents, stabilizers, or impact modifiers, unless otherwise noted.

¹⁷Data for polyvinyl acetate produced and sold in latex form includes the weight of any protective colloids which are used as emulsions stabilizers and form an integral part of the resin system. Production and sales do not include polyvinyl acetate used as a reactive intermediate for polyvinyl alcohol or other vinyl resins.

¹⁸Production and sales do not include polyvinyl alcohol used as a reactive intermediate for polyvinyl butyral or other vinyl resins.

¹⁹Includes acrylic resins (sales only), cellulose plastics (sales only), coumarone-indene resins, fluorocarbon resins except PTFE, polybutylene type resins, polyester resins, saturated (sales only), polyphenyl aromatic ester resins, and other thermoplastics materials.

Note.--Data reported to the U.S. International Trade Commission do not necessarily coincide with that reported to the Society of the Plastics Industry (SPI) because of differences in both the reporting instructions and in the coverage of certain resins.

Cellulose nitrate	DUP, X.
ethyl cellulose	X.
Cellulose plastics, all other	DOM, DUP, EKT.
Chlorinated polyolefins, thermoplastic	EKA, HPC, NEV, VEL, ZGL.
Comarone-indene resins	DUP, HPC, NEV, VEL, ZGL.
* ENGINEERING PLASTICS:	
Acetal resins	CEL, DUP, MID, PPG.
Polycarbonate resins	GB, MOB.
Polyamides and amide-imide polymers	AHO, BAS, DUP, EW, MON, PDI.
Polyphenylene oxide type resins	GE.
Polyphenylene sulfide resins	PLC.
Poly sulfone resins	UCC.
FLUOROCARBON RESINS:	
Chlorotrifluoroethylene resins	ACS.
* Polytetrafluoroethylene (PTFE)	ACS, DUP, ICI.
Polyvinylidene fluoride resin	PAS.
Fluorocarbon resins, all other	DUP.
* Petroleum hydrocarbon resins	EKA, ENJ, GYR, HPC, ICF, NEV, NPV, RCI, SCM, SM, VEL, ZGL.
Phenoxyl (R) Resins (other than for coating and adhesives)	UCC.
* POLYAMIDE RESINS:	
* Non-nylon type, polyamide resins	AMP, AZS, CBY, COO, DGO, EFH, EHR, MCC, SCP, SM, SNW, USM.
* Nylon type, polyamide resins	ALP, AZS, BCM, CEL, CTR, DGO, DUP, FRF, HST, MON, POL, RSN, SCP, USM.
Polybutylene type resins	ENJ, SHC, WTC.

STATISTICAL HIGHLIGHTS

J. Lawrence Johnson

Rubber-processing chemicals are organic compounds that are added to natural and synthetic rubber to give them qualities necessary for their conversion into finished rubber goods. In this report, statistics are given for cyclic and acyclic compounds by use--such as accelerators, antioxidants, blowing agents, and peptizers. Data on production and sales of rubber-processing chemicals in 1978 are given in table 1.¹

Production of rubber-processing chemicals as a group in 1978 amounted to 366 million pounds, or 9.0 percent less than the 402 million pounds in 1977. Sales of rubber-processing chemicals in 1978 amounted to 228 million pounds, valued at \$287 million, compared with 238 million pounds, valued at \$278 million, in 1977.

The production of cyclic rubber-processing chemicals in 1978 amounted to 325 million pounds, or 8.6 percent less than the 356 million pounds in 1977. Sales in 1978 were 201 million pounds, valued at \$258 million, compared with 202 million pounds, valued at \$249 million, in 1977. Of the total production of cyclic rubber-processing chemicals in 1978, accelerators, activators, and vulcanizing agents accounted for 36.2 percent and antioxidants, antiozonants, and stabilizers for 58.7 percent. Production of antioxidants, antiozonants, and stabilizers, which amounted to 190.9 million pounds in 1978, included 127.9 million pounds of amino compounds and 63.0 million pounds of phenolic and phosphite compounds. Sales of amino antioxidants, antiozonants, and stabilizers in 1978 amounted to 78.7 million pounds, valued at \$102.1 million; sales of phenolic and phosphite antioxidant, antiozonants, and stabilizers, were 39.7 million pounds, valued at \$43.3 million.

Production of acyclic rubber-processing chemicals in 1978 amounted to 40.8 million pounds, or 12.2 percent less than the 46.5 million pounds reported for 1977. Sales in 1978 totaled 27.9 million pounds, valued at \$28.8 million, compared with 35.8 million pounds, valued at \$29.0 million, in 1977. Dithiocarbamic acid derivatives accounted for 20.9 percent of sales (based on quantity) of acyclic rubber-processing chemicals in 1978.

STATISTICAL HIGHLIGHTS

Eric Land and Rick Talisman

Elastomers (synthetic rubber) are high polymeric materials with properties similar to those of natural rubber. The term "elastomers" as used in this report, means a substance, whether in bale, crumb, powder, latex, and other crude form, which can be vulcanized or similarly processed into a material that can be stretched to at least twice its original length and, after having been so stretched and the stress removed, will return with force to approximately its original length. U.S. production and sales of elastomers in 1978 are shown in table 1.¹

Total U.S. production² of synthetic rubber in 1978 amounted to 5,761 million pounds, a decrease of 0.9 percent from that produced in 1977. Total sales² of elastomers in 1978 amounted to 3,640 million pounds, a decrease of 12.9 percent from that sold in 1977.

Styrene-butadiene rubber (SBR, o. S-type rubber) in 1978 continued to be the elastomer produced in the greatest quantity as it has been for more than a quarter of a century. U.S. production of S-type rubber, including 43 million pounds of its vinylpyridine sub-type, amounted to 3,037 million pounds in 1978, a decrease of 7.6 percent from that reported for 1977. Solution polymerized butadiene rubber, a stereo type elastomer, was produced domestically in 1978 in the next largest amount--802 million pounds. Other principal types of synthetic elastomers for which U.S. production data are reported separately are ethylene-propylene rubber, production of which was 385 million pounds in 1978, isobutylene-isoprene (butyl) rubber, production of which was 297 million pounds,³ acrylonitrile butadiene (N-type) rubber, production of which was 145 million pounds, and polychloroprene (Neoprene) rubber, production of which was 310 million pounds.³

Sales of S-type rubber by U.S. producers in 1978 (including its vinylpyridine sub-type) amounted to 1,542 million pounds, a decrease of 21 percent over sales reported for 1977. Sales of solution polymerized butadiene rubber amounted to 317 million pounds, and those of ethylene-propylene rubber to 324 million pounds. Sales of N-type rubber in 1978 amounted to 123 million pounds. Sales of solution polymerized butadiene rubber in 1978 decreased from sales in 1977 by 42 percent, and sales of ethylene-propylene rubber increased 9 percent. Sales of N-type rubber in 1978 were 4 percent below those in 1977.

¹See also table 2 which lists these products and indicates the manufacturers of each by code. The codes are identified by company name in table 3.

²Does not include urethane type elastomers.

¹The term "elastomers" is defined as substances in bale, crumb, powder, latex, and other crude forms which can be vulcanized or similarly processed into materials that can be stretched at 68° F. to at least twice their original length and, after having been stretched and the stress removed, will return with force to approximately their original length.

²Includes oil content of oil-extended elastomers.

³Calculated from unrounded figures.

⁴Included in "All other elastomers." The production of polychloroprene rubber in 1978 was reported by the Rubber Manufacturers' Association to be 161,427 metric tons (355,878,736 pounds).

⁵Included in "All other elastomers." The production of butyl rubber in 1978 was reported by the Rubber Manufacturers' Association to be 154,365 metric tons (340,309,992 pounds).

⁶The data on production and sales of urethane elastomers are reported in the section "Plastics and Resin Materials" with urethane plastics and polyols.

⁷Includes production and sales for acrylic ester, butyl, chloroprene, epichlorohydrin, fluorinated, isobutylene, isoprenes, and polysulfide elastomers, certain solution elastomers, chlorinated rubber, chlorosulfonated polyethylene, thermoplastic rubber, miscellaneous elastomers.

STATISTICAL HIGHLIGHTS

J. Lawrence Johnson

Plasticizers are organic chemicals that are added to synthetic plastics and resin materials to (1) improve workability during fabrication, (2) extend or modify the natural properties of these materials, or (3) develop new improved properties not present in the original material. Table 1 presents statistics on U.S. production and sales of plasticizers in as great a detail as is possible without revealing the operations of individual producers.

U.S. production of plasticizers totaled 2,086 million pounds in 1978, an increase of 16.4 percent from the 1,792 million pounds reported for 1977. Sales of plasticizers totaled 1,748 million pounds, valued at \$703 million, in 1978 compared with 1,668 million pounds, valued at \$632 million, in 1977.

Production of cyclic plasticizers in 1978, which consisted chiefly of the esters of phthalic anhydride, phosphoric acid, and trimellitic acid, amounted to 1,673 million pounds, an increase of 21.7 percent from the 1,375 million pounds reported for 1977. Sales of cyclic plasticizers in 1978 totaled 1,380 million pounds, valued at \$487 million, compared with 1,302 million pounds, valued at \$425 million, in 1977. The most important cyclic plasticizers were the dioctyl phthalates, with production of 409 million pounds, in 1978.

Production of acyclic plasticizers in 1978 totaled 413 million pounds, a decrease of 1.1 percent from the 417 million pounds reported for 1977. Sales of acyclic plasticizers totaled 367 million pounds, valued at \$216 million, in 1978, compared with 366 million pounds, valued at \$208 million, in 1977. Epoxidized soya oils were the most important acyclic plasticizer in 1978 with production of 90 million pounds.

STATISTICAL HIGHLIGHTS

Eric Land and J. Lawrence Johnson

The surface-active agents included in this report are organic chemicals that reduce the surface tension of water or other solvents and are used chiefly as detergents, dispersing agents, emulsifiers, foaming agents, or wetting agents in either aqueous or nonaqueous systems. Waxes and products used chiefly as plasticizers are excluded. Surface-active agents are produced from natural fats and oils, from silvichemicals such as lignin, rosin, and tall oil, and from chemical intermediates derived from coal tar and petroleum. A major part of the output of the bulk chemicals shown in this report is consumed in the form of packaged soaps and detergents for household and industrial use. The remainder is used in the processing of textiles and leather, in ore flotation and oil-drilling operations, and in the manufacture of agricultural sprays, cosmetics, elastomers, foods, lubricants, paint, pharmaceuticals, and many other products.

The statistics for production and sales of surface-active agents are grouped by ionic class and by chemical class and subclass. All quantities are reported in terms of 100-percent organic surface-active ingredient and thus exclude all inorganic salts, water, and other diluents. Sales statistics reflect sales of bulk surface-active agents only; sales of formulated products are excluded.

Total U.S. production of surface-active agents in 1978 amounted to 4,738 million pounds, or 0.4 percent more than the 4,718 million pounds reported for 1977. Sales of bulk surface-active agents in 1978 amounted to 2,708 million pounds, valued at \$966 million, compared with sales in 1977 of 2,515 million pounds, valued at \$875 million. In terms of quantity, sales in 1978 were 7.7 percent higher than in 1977; in terms of value, sales in 1978 were 10.4 percent greater than in 1977.

Production of anionic surface-active agents in 1978 amounted to 3,094 million pounds, or 65.3 percent of the total output reported for 1978. Sales of anionics in 1978 amounted to 1,511 million pounds valued at \$359 million.

Production of cationic surface-active agents in 1978 amounted to 296 million pounds, 0.4 percent less than the 297 million pounds reported in 1977. Production of nonionic surface-active agents amounted to 1,324 million pounds in 1978, 10.8 percent greater than the 1,195 million pounds reported in 1977. Sales of cationic surface-active agents in 1978 decreased by 4.6 percent in terms of quantity but increased 7.6 percent in terms of value over 1977. Sales of nonionics in 1978, however, increased by 12.9 percent, in terms of quantity and by 14.9 percent in terms of value over 1977.

The difference between production and sales reflects inventory changes and captive consumption of soaps and surface-active agents by synthetic rubber producers, and by manufacturers of cosmetics, packaged detergents, bar soaps, and other formulated consumer products. In some instances the difference may also reflect quantities of surface-active agents used as chemical intermediates, e.g., nonionic alcohol and alkylphenol ethoxylates which may be converted to anionic surface-active agents by phosphation or sulfation.

¹All quantities are given in terms of 100 percent organic surface-active ingredient.

²Sales include products sold as bulk surface-active agents only.

³Calculated from unrounded figures.

⁴The term "benzenoid" used in this report, describes any surface-active agents, except lignin derivatives, whose molecular structure includes 1 or more 6-membered carbocyclic or heterocyclic rings with conjugated double bonds (e.g., the benzene ring or the pyridine ring).

⁵Includes ligninsulfonates.

⁶Includes all other natural fats and oils, sulfated.

1,1-Bis(carboxymethyl)-2-undecyl-2-imidazolium hydroxide, disodium salt	BRD, WTC.
(1-Carboxyheptadecyl)trimethylammonium hydroxide, inner salt	DUP.
(Carboxymethyl)[3-(coconut oil amido)propyl]dimethyl ammonium chloride, sodium salt	X.
(Carboxymethyl)[3-(coconut oil amido)propyl]dimethyl ammonium hydroxide, inner salt	HLI, WH.
1-Carboxymethyl-2-heptadecyl-1-(2-hydroxyethyl)-2-imidazolium hydroxide, sodium derivative, sodium salt	MIR.
1-Carboxymethyl-1-(2-hydroxyethyl)-2-nonyl-2-imidazolium hydroxide, sodium derivative, sodium salt	MIR.
1-Carboxymethyl-1-(2-hydroxyethyl)-2-undecyl-2-imidazolium hydroxide, sodium derivative, sodium salt	GAF, MIR.
N-(Coconut oil alkyl)-D-alanine, sodium salt	DUP, SCP.
N-Dodecyl-3-iminodipropionic acid	SCP.
Heptadecylbenzimidazolesulfonic acid, sodium salt	CGY.
Mixed acyclic primary amines, ethoxylated and sulfated, sodium salt	DUP, RH.

SURFACE-ACTIVE AGENTS	MANUFACTURERS' IDENTIFICATION CODES (ACCORDING TO LIST IN TABLE 3)
AMPHOTERIC--CONTINUED	
Oleic acid-ethylenediamine condensate, propoxylated and sulfated sodium salt	S.
Polypeptide ammonium salt	X.
Polypeptide ethyl ester	X.
Polypeptide, sodium salt	X.
N-(tallow alkyl)-3-aminodipropionic acid, disodium salt	SCP.
Amphoteric surface-active agents, all other	ARC, DUP, MIR, MOA, SBC, SCP.
ANIONIC	
*CARBOXYLIC ACIDS (AND SALTS THEREOF):	
*AMINE SALTS OF FATTY, ROSIN, AND TALL OIL ACIDS:	
Coconut oil acids, ethanolamine salt	SBP.
Mixed fatty acids, ethanolamine salt	SBP.
Oleic acid, butylamine salt	DYS.
Oleic acid, diethylamine salt	ASH, WTC.
Rosin acids, triethanolamine salt	AES, ONX.
Stearic acid, N,N',N"-tetrakis(2-hydroxyethyl) ethylenediamine salt	ICI, X.
Stearic acid, triethanolamine salt	GLY.
Tallow acids, ethanolamine salt	SBP.
Tallow acids, triethanolamine salt	SBP.
Amine salts of fatty, rosin, and tall oil acids, all other	RWC, USR, VAL, WM, X, X.
*CARBOXYLIC ACIDS HAVING AMIDE, ESTER, OR ETHER LINKAGES:	
N-(Coconut oil acyl)polypeptide, potassium salt	X.
N-(Coconut oil acyl)polypeptide, triethanolamine salt	X.
N-(Coconut oil acyl)sarcosine	HMP.
N-(Coconut oil acyl)sarcosine, sodium salt	HMP.
N-Lauroylsarcosine	HMP.
N-Lauroylsarcosine, sodium salt	CP, HMP, ONX.
N-Oleoylpolypeptide, sodium salt	LMJ.
N-Oleoylsarcosine	HMP.
Carboxylic acids with amide, ester or ether linkage, other	BRD, CHP, HMP, X.

Polyhydric alcohol, ethoxylated and phosphated	DEX, SCP.
*Tridecyl alcohol, ethoxylated and phosphated	DAN, GAP, MIL, SNW, WTC, X.
Alcohols and phenols, alkoxyLATED and phosphated or polyphosphated, all other	BAS, CHP, GAP, MIL, TCH, X.
ALCOHOLS, PHOSPHATED OR POLYPHOSPHATED:	
Butyl phosphate, potassium salt-	DUP.
Decyl and octyl phosphate-	GAP.
Decyl polyphosphate, sodium salt	GAP.
2-Ethylhexyl phosphate	TCC.
2-Ethylhexyl phosphate, sodium salt-	CHP, USM, WTC.
2-Ethylhexyl polyphosphate-	X.
2-Ethylhexyl polyphosphate, sodium salt-	X.
Hexyl phosphate-	ICI, SFS.
Hexyl phosphate, potassium salt-	ICI.
Hexyl polyphosphate, potassium salt-	DEX.
Mixed alkyl phosphate-	CTL, DUP, SPS, STC, X.
Mixed alkyl phosphate, diethanolamine salt	DUP.
Octyl decyl phosphate-	X.
Octyl phosphate-	SCP, TCC, WTC, X.
Octyl phosphate, alkylamine salt	DUP, SCP.
Octyl phosphate, potassium salt-	DEX, DUP.
Octyl polyphosphate-	DEX.
Octyl polyphosphate, potassium salt-	SNW, X.
Phosphated and polyphosphated alcohols, all other	DUP, HRT, MIL, VAL, X.

BENZENE-, CUMENE-, TOLUENE-, AND XYLENESULFONATES:	
Cumenesulfonic acid, ammonium salt	NES, WTC.
Cumenesulfonic acid, sodium salt	NES, STP, WTC.
Toluenesulfonic acid, potassium salt	NES.
Toluenesulfonic acid, sodium salt	CO, NES, PG, WTC.
*Xylenesulfonic acid, ammonium salt	CO, NES, STP, WTC.
*Xylenesulfonic acid, sodium salt	CO, ICI, NES, PIL, SDC, STP, WTC.
Benzene-, cumene-, toluene-, and xylenesulfonates, all other	WTC.
*LIGNINESULFONATES:	
Ligninsulfonic acid, ammonium salt	CRZ, SPA.
Ligninsulfonic acid, calcium salt	CRZ, CMP, LKY, MAR, PSP.
Ligninsulfonic acid, chromium salt	MAR, PSP, RAY.
*Ligninsulfonic acid, iron salt	CRZ, MAR, PSP.
Ligninsulfonic acid, magnesium salt	MAR.
*Ligninsulfonic acid, sodium salt	CRZ, MAR, PSP, RAY, WVA.
Ligninsulfonic acid, zinc salt	MAR, PSP.
Ligninsulfates, all other	AZS, X.
*NAPHTHALENESULFONATES:	
Butylnaphthalenesulfonic acid, sodium salt	DA, ECC.
Dibutylnaphthalenesulfonic acid	GAF.
*Diisopropylnaphthalenesulfonic acid, sodium salt	DA, DUP, UDI.
Dipentylnaphthalenesulfonic acid	X.
Dipentylnaphthalenesulfonic acid, (mixed alkyl) ammonium salt	X.
Dipentylnaphthalenesulfonic acid, ammonium salt	X.
Methylenedis(2-naphthalenesulfonic acid), sodium salt	DUP.
Methylnaphthalenesulfonic acid, sodium salt	DA, UDI.
Methylnonylnaphthalenesulfonic acid, sodium salt	DA, UDI.
Naphthalenesulfonates, all other	DUP.
*SULFONIC ACIDS HAVING AMIDE LINKAGES:	
*SULFOSUCCINAMIC ACID DERIVATIVES:	
N-(1,2-Dicarboxyethyl)-N-octadecylsulfosuccinamic acid, tetrasodium salt	ACY, MOA.

Sulfosuccinamic acid derivatives, all other--	ARD.
*TAURINE DERIVATIVES:	
N-(Coconut oil acyl)-N-methyltaurine, sodium salt	GAF, TMI.
N-Cyclohexyl-N-palmitoyltaurine, sodium salt	GAF.
N-Methyl-N-oleoyltaurine, sodium salt	GAF, HFT, STC.
N-Methyl-N-palmitoyltaurine, sodium salt	GAF.
N-Methyl-N(tall oil acyl)taurine, sodium salt	CRT, GAF, USM, X.
ALL OTHER SULFONIC ACIDS HAVING AMIDE LINKAGES:	
Sulfonic acids having amide linkages, all other	DA.
*SULFONIC ACIDS HAVING ESTER OR ETHER LINKAGES:	
*SULFOSUCCINIC ACID ESTERS:	
Sulfosuccinic acid-bis(diisobutyl)ester, sodium salt	MOA.
Sulfosuccinic acid, bis(2,6-dimethyl-4-heptyl) ester, sodium salt	DAN, MOA, PC.
*Sulfosuccinic acid, bis(2-ethylhexyl)ester, sodium salt	ACY, CRP, CRT, DAN, ECC, EMK, HDG, MCP, MOA, RH, SBC, SCO, SOS, USM, WTC.
Sulfosuccinic acid, dihexyl ester, sodium salt	ACY, MOA.
Sulfosuccinic acid, diisodecyl ester, sodium salt	ACY.
Sulfosuccinic acid, dipentyl ester, sodium salt	ACY, DA.
Sulfosuccinic acid, dtridecyl ester, sodium salt	ACY, MOA.
Sulfosuccinic acid esters, all other	ARD, HDG, LAK, RH, SCP, WTC.
ALL OTHER SULFONIC ACIDS HAVING ESTER OR ETHER LINKAGES:	
Coconut oil acids, 2-sulfoethyl ester, sodium salt	GAF, LEV.
Dodecylidiphenyloxidedisulfonic acid, disodium salt	CTL, DCC, X.
Dodecyl sulfoacetate, sodium salt	STP.

Iso-octylphenol, ethoxylated and sulfonated, sodium salt	RH.
n-Octylphenol, ethoxylated and sulfonated, sodium salt	CRT.
Sulfonic acids with ether linkages, all other	PG, USB, WTC, X.
OTHER SULFONIC ACIDS:	
Mixed alkane sulfonic acid, sodium salt	CEL, DUP, QCP, X.
Sulfosuccinic acid-half ester (Coconut mono-isopropenylamide, disodium salt)	MOA.
Sulfonic acids, all other	ARD, LAK, RBC, SLM, STP, WTC.
*SULFURIC ACID ESTERS (AND SALTS THEREOF):	
*ACIDS, AMIDES, AND ESTERS, SULFATED:	
Coconut oil acids-ethanolamine salt, sulfated, potassium salt	EAK.
CARBOXYLIC ACID ESTERS (EXCEPT NATURAL FATS AND OILS), SULFATED:	
ESTERS OF SULFATED OLEIC ACID:	
2-Rutoxyethyl oleate, sulfated, sodium salt	S.
*Butyl oleate, sulfated, sodium salt	AKS, CHP, CIN, CRT, ICI, MRV, PC.
Butyl and propyl oleate, sulfated, sodium salt	MCP.
*Isobutyl oleate, sulfated, sodium salt	DA.
*Isopropyl oleate, sulfated, sodium salt	CRT, DEY, HRT.
*Methyl oleate, sulfated, sodium salt	DUP, ICI.
*Propyl oleate, sulfated, sodium salt	ACY, AKS, CHP, GAF, MRV.
Esters of sulfated oleic acid, all other	CHP.
OTHER SULFATED ESTERS:	
Glycerol monoester of coconut oil acids, sulfated, sodium salt	CP, X.
9-Octadecyl acetate, sulfated, sodium salt	DUP.
Sulfated esters, all other	DA.
OTHER SULFURIC ACID ESTERS:	
Mixed fatty acids, sulfated, potassium salt	SCO.
Oleic acid, sulfated, disodium salt	ACT, ACY, DA, TEN.
Sulfuric acid esters, all other	BPP, SLM, TEN.
*Tall oil, sulfated, sodium salt	ACT, API, BAO, CHP, CRT, ICI, KAL, SEA, SOS, WHI, WHW.

1-(2-Aminoethyl)-2-nor(tall oil alkyl)-2-imidazoline	SCP.
N-(Docosyl and eicosyl)trimethylenediamine	ENO.
2-Heptadecyl-2-imidazoline	CGY, SCP.
N-(Cocount oil alkyl)trimethylenediamine	ARC, SCP.
N-nodacyldiethylenetriamine	ARC.
N-(Mixed alkyl)polyethylenepolyamine	ARC, CCW, SNW.
N-(9-Octadecyl)trimethylenediamine	ARC, ASH, ENO, SCP.
N-(Soybean oil alkyl)trimethylenediamine	ENO.
N-(tallow - alkyl)dipropyltetramine	NCW, SCP.
N-(tallow alkyl)trimethylenediamine	ARC, ASH, ENO, SCP.
Diamines and polyamines, all other	ARC, ENO, ICI, NCW, STC, X.
*PRIMARY MONOAMINES:	
(Cocount oil alkyl)amine	ARC, ASH, ENO, SCP.
(Docosyl and eicosyl)amine	ENO.

IMPORTANT DEVELOPMENTS IN PESTICIDES IN 1978

Edmund Cappuccilli

During 1978, the most important developments affecting pesticide producers and consumers were the result of U.S. Government actions. The Congress passed the Federal Pesticide Act of 1978 which provides for a more efficient registration process for pesticides and incentives for the development of new pesticides. The Environmental Protection Agency (EPA) which administers pesticide legislation made several important decisions in 1978 concerning pesticides, the most important of which are discussed below.

Other noteworthy developments covered in this paper are the registration of two new pesticides which were developed to biologically control specific insects and the concept of Integrated Pest Management (IPM), which was promoted by several Government agencies to decrease the use of synthetic pesticides in the United States.

Biological Pesticides

In 1978, the pesticide industry produced several new pesticides, namely insect pheromones. Insect pheromones, or sex attractants, have long been desired as insect control agents because of their low toxicity and relatively fast degradation time. Unfortunately, the identification and the synthesis of these compounds have been very slow because of the small amounts available and the high degree of specificity required for each insect specie.

Despite these problems, the EPA recently approved the use of a synthetically produced pheromone to control the pink ballworm caterpillar. This pheromone is sprayed on an infected cotton field to prevent the male insects from mating. Because of the specific nature of this pheromone, beneficial insects are not destroyed. It has also been shown that resistance to this chemical through evolution has been almost nonexistent. With the initial success of this and some other synthetic pheromones, and the favorable response from the EPA, it does not seem long before the major pesticide producers will allocate more time and money to this field of insect control.

Another type of biological pest control which scientists have been investigating for some time is the synthesis of natural viruses to destroy specific insects. The EPA has approved a synthetic insect virus to combat the gypsy moth. Scientists from the Federal Government, private industry, and several universities discovered how to produce this lethal moth virus. After 1 or 2 years of field trials, this product should be available to supplement other conventional chemical controls used to combat this insect.

Integrated Pest Management

Over the past few years, several Federal and State agencies have been promoting the concept of IPM to reduce the amount of chemical pesticides used

in this country. Nonchemical pest controls, including the use of biological pesticides such as those mentioned above, are being reemphasized because of the increasing costs of chemical pesticides, buildup of insect resistance to some pesticides, and environmental hazards. It has also been suggested that IPM be used to restrict the use of certain pesticides by incorporating this procedure in the EPA's registration/reregistration process.

Several Government agencies have issued reports for farmers emphasizing IPM rather than chemical pesticides alone. Some nonchemical practices include crop monitoring for insects and disease before using pesticides, crop rotation, introduction of insect predators, and biological pesticides. Farmers at one time or another have used one or more of these techniques, but for the past few decades have been relying more on chemical pesticides. Additional research on IPM techniques is now being conducted by various agencies to increase cost effectiveness on certain crops to make this practice more desirable to farmers. Government officials now believe that farmers will incorporate some of the IPM techniques into their crop management programs but will not greatly decrease their dependence on chemical pesticides until IPM is shown to be cost effective.

Government Regulations

After several months of hearings in both the House and the Senate, the Congress passed the Federal Pesticide Act of 1978. The following are the major provisions of the 1978 Amendments to the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA):

- (1) Increased authority is given to the states regarding enforcement responsibility and to register Federally approved pesticides for additional uses within their states, subject to certain conditions, without EPA authorization.
- (2) Data compensation and exclusive use for a specified period of time to encourage the development of new products.
- (3) Clarification of the uses consistent with the labeling on pesticides.
- (4) Authority to grant conditional registrations for pesticides without data under certain circumstances.
- (5) Simplification of the registration procedure in primary and minor use areas.

In general, the Pesticide Act of 1978 should benefit all who are involved with pesticides and should increase the efficiency of the registration process while encouraging the development of new products and making available to farmers a variety of registered products.

One of the provisions of the 1978 Amendment states that before a pesticide is placed on the "Rebuttable Presumption Against Registration" (RPAR) list, the EPA must confidentially inform the producer and give that firm an opportunity to supply exonerating data to the agency.

In 1978, 2,4,5-trichlorophenoxyacetic acid (2,4,5-T) and 2,4,5-trichlorophenol (2,4,5-TCP) and its salts were added to the RPAR list. The EPA took this action because of the presence of small amounts of dioxin, a powerful teratogen and carcinogen. The dioxin is produced as a byproduct when these pesticides are manufactured. One of these products, the herbicide 2,4,5-T, has caused some controversy because it is alleged to have caused miscarriages. The EPA is now investigating this allegation and also reports that this herbicide has caused cancer in some Vietnam veterans who were exposed to it while in Vietnam. Any final decision on this product, however, is expected to take some time because the EPA must carefully examine all the risks and the benefits associated with each product. So far only two pesticides, chlorobenzilate and dibromochloropropane (DBCP), have gone through the RPAR process. Both products, especially DBCP, have been greatly restricted in their uses.

Production, Sales, and Consumption

Production of synthetic organic pesticides in 1978 increased slightly from the 1977 level. Total synthetic organic pesticide production in 1978 was 1.42 billion pounds, 2 percent greater than the 1.39 billion pounds produced in 1977. Production of herbicides declined by 1.6 percent to 664 million pounds owing mainly to increased inventories and lower consumer demand. Overall demand for herbicides was lower than anticipated because of an unusually wet spring in many parts of the country. On the other hand, fungicide production showed some strength by increasing 3 percent over the 1977 level to 148 million pounds. The quantity of sales of pesticides in 1978 remained at the 1977 level of 1.3 billion pounds; however, the value of sales increased by 6.0 percent to \$2.0 billion. The average unit value of sales increased from \$2.22 in 1977 to \$2.34 in 1978.

U.S. consumption of organic pesticides in the unmixed form in 1978 decreased by approximately 7 percent to 1.1 billion pounds, valued at \$2.8 billion from the 1977 level. The decline in consumption was due primarily to heavy rains in some parts of the country which delayed planting of crops and to larger than normal pesticide inventories at the beginning of 1978.

Foreign Trade

Imports of benzenoid pesticides (TSUS item 405.15) in 1978 amounted to 71.7 million pounds valued at \$161 million. These pesticide imports represented an increase in both quantity and value of 44 and 59 percent, respectively, more than the 49.7 million pounds of pesticides valued at \$101

million imported in 1977. The large increase in pesticide imports registered in 1978 is due primarily to an increase in consumer demand for certain proprietary products and an unexpectedly large volume of herbicides exported from Switzerland. Future imports of pesticides are expected to increase but not at the rate experienced in 1978. As in most commodities, the import value of these products may increase at a faster rate in the next few years because of inflationary pressures and the fluctuations of world currencies.

Total imports of benzenoid pesticides in 1978 continued to be dominated by West Germany as shown in table A. The quantity of imports from West Germany amounted to 30.6 million pounds, or by 43 percent of the total benzenoid pesticide imports. These imports consisted mainly of the herbicide, bentazon, which amounted to 18 million pounds in 1978. It is expected that West Germany will continue to dominate pesticide imports for the next several years because of their strong commitment to research and development of new environmentally safe pesticides.

Imports from countries designated to benefit from the Generalized System of Preferences (GSP) in 1978 were valued at \$6.4 million, or by 4 percent of the total value of pesticides imports. Although this was an increase of 54 percent in terms of value from 1977, the market penetration of GSP imports remained the same as 1977. Israel was the principal GSP country with exports to the United States valued at \$4.2 million. Imports from GSP countries are expected to remain around 4 to 5 percent of total imports in the future because of the increased demand for "noncompetitive" pesticides which are, in many cases, more effective and environmentally safer than the "competitive" products usually exported from GSP countries. The total amount of imports is expected to increase at a moderate rate over the next few years because of consumer demand for certain pesticides.

Exports of pesticides and their preparations in 1978 amounted to 618 million pounds valued at \$901 million. Unmixed pesticide exports amounted to 314 million pounds valued at \$490 million. The major markets for U.S. pesticides are listed in table B with the values of unmixed pesticides and pesticide preparations, which were exported from the United States in 1978. Belgium and Canada, the leading importers of U.S. pesticides, imported mainly herbicide preparations. Canada imported a large variety of pesticides in addition to herbicides (e.g., fungicides, insecticides, and fumigants), while Belgium concentrated mainly on herbicides and fungicides. Canada, Belgium, and other European export markets for pesticides are not expected to grow rapidly in the next few years because most of the usable land is already under cultivation.

The areas of greatest export potential are generally regarded as the South American and Asian markets. Many of these countries are already importing increasing amounts of insecticides along with smaller amounts of herbicides, fungicides, and plant growth regulators. It is anticipated that exports to these countries could increase rapidly over the next several years if the U.S. products can remain competitive.

The pesticide industry maintained a positive balance of trade in 1978. Total imports of pesticides, 1/ valued at \$205 million, were only 23 percent of the export's value of \$901 million, for a positive balance of trade of \$696 million. The balance of trade in the pesticide industry is expected to remain positive over the next several years because of the competitiveness of U.S. pesticide products and consumer preference for certain U.S. pesticides. However, the relative U.S. advantage is declining. Several major European and Japanese pesticide producers are continuing to develop new environmentally safe products, although at a somewhat declining rate because of increasing cost. In the field of insecticides, new synthetic pyrethroids from Japan and England will probably increase in volume in the coming years. Herbicides continue to account for the largest amount of patent applications for pesticides in Japan and Europe, especially the products concerned with broader spectrum uses and lower toxicity. Future patent applications for pesticides by firms in these countries should continue to enhance their competitive position in the world market.

STATISTICAL HIGHLIGHTS

Edmund Cappuccilli

Pesticides and related products include fungicides, herbicides, insecticides, rodenticides, and related products such as plant growth regulators, seed disinfectants, soil conditioners, soil fumigants, and synergists. The data are given in terms of 100 percent active materials; they exclude such materials as diluents, emulsifiers, and wetting agents.

U.S. production of pesticides and related products in 1978 amounted to 1,416 million pounds--2.1 percent greater than the 1,388 million pounds reported for 1977 (table 1).¹ Sales in 1978 were 1,300 million pounds, an increase of 2.9 percent, as compared with 1,263 million pounds reported in 1977; the value of sales was \$3,041 million in 1978, compared with \$2,808 million in 1977--an increase of 8.3 percent.

The output of cyclic pesticides and related products amounted to 982 million pounds in 1978--1.2 percent less than the 994 million pounds produced in 1977. Sales in 1978 were 944 million pounds, valued at \$2,314 million compared with 904 million pounds, valued at \$2,066 million in 1977.. Production of acyclic pesticides and related products in 1978 amounted to 434 million pounds, compared with 394 million pounds reported for 1977, an increase of 10.3 percent. Sales in 1978 were 357 million pounds, a decrease of about 0.7 percent, as compared with 359 million pounds reported in 1977; the value of sales was \$728 million in 1978, compared with \$742 million in 1977--a decrease of 1.9 percent.

¹Calculated from unrounded figures.

²Includes benomyl, captafol, captan, chlorothalonil, dinocap, DMTT, folpet, pentachloronitrobenzene, sodium pentachlorophenate, 2,4,5-trichlorophenol salts, all other phenylmercury compounds, and others.

³Includes maleic hydrazide.

⁴Includes alachlor, atrazine, barban, benefin, bensulfide, 2,4-D acid (esters and salts), 2,4-DB, dicamba, dinitrophenol compounds, diuron, isopropyl phenylcarbamates (IPC and CIPC), MCPA, molinate, NPA, picloram, propanil, silvex and its esters, 2,4,5-T acid (esters and salts), triazines, trifluralin, uracils, and others.

⁵Includes carbofenthoion, diazinon, dioxanthion, EPN, methyl parathion, parathion, and other phosphorothioates and phosphorodithioates.

⁶Includes carbaryl, carbofuran, chlorinated insecticides (chlordan, chlorobenzilate, DDT, dicofol, endrin, heptachlor, methoxychlor, and others), insect attractants, DEET and other insect repellents, small amounts of rodenticides, and others.

⁷Includes ferbam, maneb, nabam, and zineb, plus the remaining dithiocarbamates which are used chiefly as fungicides.

⁸Includes dodine, and others.

Footnotes--Continued

⁹Includes butylate, dalapon, methanearsonic acid salts, sodium TCA, thiocarbamates, and organophosphorus herbicides, and others.

¹⁰Includes acephate, DDVP, disulfoton, ethion, malathion, naled, phorate, and other organophosphorus insecticides.

¹¹Includes methyl bromide, soil conditioners and fumigants, aldicarb, small quantities of rodenticides, and others.

Note.--Does not include data for the insect fumigant, p-dichlorobenzene nor the fungicide, o-phenylphenol. These data are include in the section on "Cyclic Intermediates." It also does not include data for the fungicides, dimethyldithiocarbamic acid, sodium salt and dimethyldithiocarbamic acid, zinc salt (i.e., ziram). These data are included in the section on "Rubber-Processing Chemicals." The data for ethylene dibromide, a fumigant, are included in the "Miscellaneous End-Use Chemicals and Chemical Products" section.

SECTION XIV -- MISCELLANEOUS END-USE CHEMICALS
AND CHEMICAL PRODUCTS

293

STATISTICAL HIGHLIGHTS

David B. Beck

This section incorporates those end-use groups which are not readily classifiable within the prior sections of this report. Both cyclic and acyclic chemicals fall within this section. With the exception of gasoline additives, both production and sales of all end-use groups contained within this section increased over 1977 levels.

In 1978 the production of miscellaneous end-use chemicals exceeded 20.6 billion pounds, an increase of 6.4 percent over the more than 19.3 billion pounds of production reported for 1977. Sales in 1978 totaled 11.7 billion pounds, valued at \$2.7 billion. The sales quantity represents an increase of 7.8 percent over that of 1977 with the value of sales increasing by 6.5 percent. As in 1977, polymers for fibers and urea again collectively accounted for 84 percent of the 1978 production of these miscellaneous end-use chemicals. Urea accounted for 76 percent of the 1978 sales quantity of these chemicals.

Production of gasoline additives for 1978 totaled 1.1 billion pounds, a decrease of 6 percent from the previous year. Total sales quantity for 1978 was 801 million pounds, down 7 percent from the 1977 sales quantity of 862 million pounds. This market is expected to continue its decline as a result of environmental legislation which restricts the use of lead alkyls in gasoline.

TABLE 1.--MISCELLANEOUS END-USE CHEMICALS AND CHEMICAL PRODUCTS: U.S.
PRODUCTION AND SALES, 1978

[Listed below are all miscellaneous end-use chemicals and chemical products for which any reported data on production or sales may be published. (Leaders (...)) are used where the reported data are accepted in confidence and may not be published or where no data were reported.) Table 2 lists all miscellaneous end-use chemicals and chemical products for which data on production and/or sales were reported and identifies the manufacturers of each]

STATISTICAL HIGHLIGHTS

David B. Beck

The term miscellaneous chemicals as it is used here comprises those synthetic organic products that are not included in the use groups covered by sections I - XIV of this report. They include products that are employed in a great variety of uses. The number of chemicals used extensively for only one purpose is not large. Among the products covered are those used for refrigerants, aerosols, solvents, and a wide range of chemical intermediates.

U.S. production of miscellaneous cyclic and acyclic chemicals in 1978 amounted to 92 billion pounds, an increase of 5.9 percent over 1977. U.S. sales for 1978 totaled 39 billion pounds valued at \$8.6 billion. Compared with 1977, sales quantity increased less than 1 percent, while sales value increased by 8.4 percent. Production of miscellaneous cyclic chemicals comprised only 2.5 percent of this section's total production.

The group among miscellaneous acyclic chemicals with the greatest volume of production and sales is the halogenated hydrocarbons. U.S. production for this group in 1978 was 24.6 billion pounds, an increase of 3.1 percent over the previous year. Production decreased in all segments of this group except chlorinated hydrocarbons. The production of fluorinated hydrocarbons decreased from 921,000 pounds in 1977 to 915,000 pounds in 1978. This segment of the industry is expected to continue its decline because of Federal regulation limiting the use of certain fluorinated hydrocarbons.

TABLE 1.--MISCELLANEOUS CYCLIC AND ACYCLIC CHEMICALS: U.S. PRODUCTION AND SALES, 1978

[Listed below are all miscellaneous cyclic and acyclic chemicals for which any reported data on production or sales may be published. (Leaders (...) are used where the reported data are accepted in confidence and may not be published or where no data were reported.) Table 2 lists all miscellaneous cyclic and acyclic chemicals for which data on production and/or sales were reported and identifies the manufacturers of each]

ACYCLIC--Continued	
*NITROGENOUS COMPOUNDS--Continued:	
2-Aminoethanol (Monoethanol amine) sulfite	EVN.
Aminoethoxyethanol	JCC, SNK.
2-(2-Aminoethylamino)ethanol (Aminoethylethanol-amine)	DOH, HDG, UCC.
2-Aminoethyl mercaptoacetate (Monoethanolamine thio-glycolate)	EVN.
2-Amino-2-ethyl-1,3-propanediol	INC.
2-Amino-2-(hydroxymethyl)-1,3-propanediol [Tris(hydroxymethyl)aminomethane]	INC.
2-Amino-2-methyl-1,3-propanediol	INC.
2-Amino-2-methyl-1,3-propanediol condensate	INC.
2-Amino-2-methyl-1-propanol	INC.
2-Amino-2-methyl-1-propanol hydrochloride	VAL.
*AMIDES:	
Acetamide	ACS, SBC.
Acrylamide monomer	DOH, X.
1,1'-Azobisformamide	FMT, NPI, USR.
N-Bromoacetamide	ARA.
Coconut oil amide	ARC.
N,N-Diethyldodecanamide	X.
N,N-Dimethylacetamide	DUP.
N,N-Dimethylformamide	ALP, DUP.
Erucamide	HUN, HXL.
Erucamide - lauramide	HKL.
N,N'-Ethylenebis-oleamide (Oleic acid-ethylenediamine condensate (Amine/acid ratio = 1/1))	ARC.
N,N'-Ethylenebis(stearamide)	CCW, GAF, HUM.
Fish oil fatty acid amide	HUM.
Formamide	DUP.
12-Hydroxystearamide	CCW.
Methacrylamide	DUP.
N-Methylacetamide	ARS.
N,N'-Methylenebis(acrylamide)	ACY.
Oleamide (Octadecene amide)	ARC, HXL.
Oleoylpalmitamide	HUM, HXL, OMC.
Stearamide (Octadecane amide)	GYR, HUM, HXL, OMC.

ACYCLIC--Continued	
*NITROGENOUS COMPOUNDS--Continued	
*AMIDES--Continued	
Stearylsuccinimide	HXL, RPC.
Tallow amide, hydrogenated	ARC.
N-Trimethylsilylacetamide	PIC.
Amides, all other--	ACY, ARS, EKT, HAL, PIC, VGC, VND, X.
*AMINES:	
Allylamines--	SHC.
Bis-hexamethylenetriamine	DUP.
*BUTYLAMINES:	
n-Butylamine, mono	AIP, PAS, VGC.
sec-Butylamine, mono	PAS.
tert-Butylamine, mono	MON.
*Di-n-butylamine--	AIP, PAS, VGC.
Diisobutylamine--	AIP, RPC, VGC.
Tri-n-butylamine--	PAS, VGC.
n-Butylethylamine--	PAS.
Diethylenetriamine--	DOM, UCC.
Diisopropylamine--	PAS, UCC.
Dimethylaminopropylamine--	ABB, JCC.
*ETHYLAMINES:	
*Diethylamine--	AIP, PAS, UCC, VGC.
*Ethylamine, mono--	AIP, PAS, UCC, VGC.
*Triethylamine--	AIP, PAS, UCC.
Ethylenediamine--	DOM, JCC, UCC.
(2-Ethylhexyl)amine, mono--	VGC.
1,6-Hexanediamine (hexamethylenediamine)	CEL, DUP, MON.
3,3'-Iminobispropylamine--	JCC.
*Isopropylamine, mono--	AIP, PAS, UCC, VGC.
METHYLAMINES:	
Dimethylamine--	AIP, DUP.
*Dimethylamine sulfate--	ARC, GAF, RH.
Methylamine, mono--	AIP, DUP, GAF, X.
Trimethyl amine--	AIP, DUP, GAF.
n-Octylamine, mono--	VGC.
PENTYLAMINES (AMYLAMINES):	
Dipentylamine--	PAS.
Pentylamine, mono--	PAS.

*NITROGENOUS COMPOUNDS--Continued:	
PENTYLAMINES (AMYLAMINES)--Continued:	
1,2-propanediamine (Propylenediamine)	VGC.
1,3-propanediamine (1,3-diaminopropane)	JCC.
Triptylamine	PAS.
PROPYLAMINES:	
Dipropylamine	AIP, PAS, VGC.
Propylamine, mono-	AIP, PAS, VGC.
Tripropylamine	PAS, VGC.
Tetraethylenepentamine	DOM, UCC.
N, N, N'-tetramethyl-1,3-butanediamine	UCC.
Tetraethylthylenediamine	RH.
Triethyltetramine	DOM, UCC.
Amines, all other	AAC, DOM, EKT, HCP, JCC, ONK, PAS, EH, UCC, USR, VGC, WAI, X, X.
1,3-Bis(hydroxyethyl)urea (Dimethylolurea)	GR, UPI.
1-Ethyl-3-ethyl-2-thiourea	PAS, UPI.
Butyl isocyanate	X.
Chlorocholine chloride	ACY.
2-Chloro-N,N-dimethylethylamine hydrochloride	VEL.
2-Chloro-N,N-dimethylethylamine (Dimethylamino ethyl chloride)hydrochloride	VEL.
2-Chloro-N,N-dimethylpropylamine hydrochloride	VEL.
3-Chloro-N,N-dimethylpropylamine hydrochloride	VEL.
Choline base	RH.
Cyanoacetic acid	KP.
1-(2-Cyanoethyl)ethyl urea	GAP.
2-Dibutylaminoethanol	PAS.
1,3-dibutyl-3-thiourea	PAS, RBC.
1,4-dicyanobutene	DUP.
2-Diethylaminoethanol (N,N-Diethylethanolamine)	PAS, UCC.
2-Diethylaminoethyl acrylate	CPS.
2-Diethylaminoethyl methacrylate	CPS, DUP.
Diethylhydroxylamine	PAS.
1,3-Diethyl-2-thiourea	PAS, RBC.
2-Diisopropylaminoethanol (N,N-Diisopropylethanolamine)	PAS, UCC.
2-Diisopropylaminoethyl methacrylate	DUP.

*NITROGENOUS COMPOUNDS--Continued:	
Di-(methoxyethyl)hydroxylamine	X.
*2-Dimethylaminoethanol (N,N-Dimethyl ethanolamine)	JCC, PAS, UCC.
Dimethylaminoethyl acrylate	CPS.
Dimethylaminoethyl methacrylate	AAC, CPS.
Dimethylaminoethylmethacrylate, methyl chloride, quaternary salt	AAC.
Dimethylamino-2-propanol	PAS.
1,1-Dimethylhydrazine	USR.
2,5-Dithioburea	FMT.
Dithiooxamide	RBC.
*ETHANOLAMINES:	
*2,2'-Aminodiethanol (Diethanolamine)	DOM, JCC, OMC, UCC.
*2-Aminoethanol (Monoethanolamine)	DOM, GVE, JCC, OMC, UCC.
*2,2',2''-Nitrioltriethanol (Triethanolamine)	DOM, JCC, OMC, UCC.
2-Ethylaminoethanol (Ethylaminoethanolamine)	PAS, UCC.
Ethyl cyanoacetate	RF.
Ethylenediamine sulfate	EK.
Ethyl formylglycine	ARC.
Formamidedisulfide dihydrochloride	WAY.
Glycine ethyl ester hydrochloride	SFS.
Glycine (Aminoacetic acid), non-medical	CHT, HMP.
*Hexamethylenediamine adipate (Nylon salt)	CEL, DUP, MON.
2-(Hydroxymethyl)-2-nitro-1,3-propanediol (Tris-(hydroxymethyl)nitromethane)	INC.
Iminodiacetic acid	HMP.
ISOPROPANOLAMINES:	
1-Amino-2-propanol (Monoisopropanolamine)	DOM.
1,1'-Iminodi-2-propanol (Diisopropanolamine)	DOM.
1,1',1''-Nitrioltri-2-propanol (Triisopropanolamine)	DOM, UCC.
2-Isopropylaminoethanol	PAS.
Isopropyl ethylthiocarbamate	DOM, MON.
Ketamine, tetrafunctional	MIL.
3-Methoxypropylamine	JCC.
2-Methylaminoethanol (N-Methyl ethanolamine)	PAS, UCC.
Methyl carbamate	BKL.

*NITROGENOUS COMPOUNDS--Continued:	
Methyl cyanoacetate	KEF.
Methyl α-cyanoacrylate	EKT.
*2,2-(Methylamino)ethanol (Methyldiethanolamine)	DOM, PAS, UCC.
Methyl isocyanate	UCC.
2-Methyl-2-nitro-1-propanol	IMC.
Nitrated lard oil	SM.
*NITRILES:	
Acetonitrile	DUP, EKK, MON, SOH.
*Acrylonitrile, monomer	ACY, DUP, MON, SOH.
Adiponitrile	DUP, MON.
n-Butylnitrile	EKK, WTT.
Crotonitrile	REC.
3-dimethylaminopropionitrile	ACY.
3-Ethoxypropionitrile	DIY.
Glycolonitrile	KEF.
Hydracrylonitrile (Ethylene cyanohydrin)	TKL.
Isobutyronitrile	AIP, EKK.
Lactonitrile	MON.
Methacrylonitrile	DOM.
*2-Methylacetonitrile (Acetone cyanohydrin)	CYR, DUP, MON, RH.
Oilonitrile (Octadecene nitrile)	ARC.
Tall oil nitrile	ASH.
Tallow nitrile	ASH, NCW.
Tallow nitrile, hydrogenated	ASH.
3,3'-Thiodipropionitrile	EWN.
Vinylacetonitrile	REC.
Nitriles, all other	ASH, HHP.
Nitroethane	IBC.
Nitromethane	IMC.
1-Nitropropane	IMC.
2-Nitropropane	INC.
Octadecyl isocyanate	MOB, URFJ.
Pentaerythritol tetranitrate	DUP, HPC.
n-Propyl carbamate	BKL.
Propylisocyanate	HPC.
Sarcosine (N-Methylaminoacetic acid)	HMP.

*NITROGENOUS COMPOUNDS--Continued:	
Semicarbazide hydrochloride--	FMT.
N,N,N'-Tetrakis(2-hydroxypropyl)ethylenediamine	BAS.
Tetramethylammonium bromide--	RSA.
Tetramethylammonium chloride	RSA.
Tetrasethylguanidine--	ACY.
Thioacetamide--	RPC.
Thiosemicarbazide--	PMT.
Nitrogenous compounds, acyclic, all other--	AGC, ABB, ACS, ARA, BKL, CHP, CPS, DAN, DOH, DUP, EK, FMT, GOC, HLI, HXL, JCC, LAK, ROB, PAS, PCH, PD, PPZ, PIC, REC, REN, RH, RSA, SBC, SCH, SCP, SDH, SK, SM, STC, TCH, TKL, TNA, USR, VAL, VEL, WAY, WYC, X, X, X, X.
*ACIDS, ACID ANHYDRIDES, AND ACYL HALIDES:	
*ACETIC ACID, 100%:	
Acetic acid, recovered (100%)	CEL, DOM, DUP, EKT, MON, RDA, UCC.
Acetic acid, synthetic (100%)	BOR, CEL, EKT, FMP, MON, OCC.
*ACETIC ANHYDRIDE, 100%:	
Acetic anhydride from acetaldehyde (100%)	EKT.
Acetic anhydride from acetic acid, other than recovered by the vapor-phase process (100%)	CEL, UCC.
Acetic anhydride from acetic acid, recovered, by vapor-phase process--	CEL.
Acetic anhydride from ethylene (100%)	MON.
*Acrylic acid--	CEL, DBC, UCC.
*Adipic acid--	ALF, CEL, DUP, MON.
Azelaic acid--	EMR.
Bromoacetic acid--	WCC.
Bromobutyric acid--	ARA, GTL.
tert-Butylperoxy maleic acid	WTC, WTL.
Butyric acid--	CEL, EKT.
Butyric anhydride--	EKT.
Butyryl chloride--	WCC.
Castor oil fatty acids, dehydrated	NIL.
Chloroacetic acid, mono--	BUK, DOH, PPZ.
Chloroacetyl chloride--	DOH.
Citric acid--	MLS, PPZ.

ACYCLIC--Continued

*ACIDS, ACID ANHYDRIDES, AND ACYL HALIDES--Continued:

Crotonic acid (2-Butenoic acid)	EKT.
Decanoyl chloride	WTL.
2,2-Dichloropropionic acid	DOW.
Dimer acid (C-36 Aliphatic dibasic acid)	CBY, EMR.
Di-n-propylacetic acid	ARA.
Dithiodipropionic acid	EVN.
Dodecanedioic acid	DUP.
*Dodecylsuccinic anhydride	BCC, DIX, HMY.
Dodecylsuccinic anhydride	HN, SM.
2-Ethylbutyric acid (Diethylacetic acid)	ICC.
2-Ethylhexanoic acid (n-Ethylcaproic acid)	EKT, DCC.
2-Ethylhexanoyl chloride	AZI, CAD, CTM, WTL.
Fatty acids, hydrogenated	GYR.
Fatty acids, non-hydrogenated	GYR.
Fatty acids, partially hydrogenated	CBY, GYR.
Formic acid, 90%	CEL, DCC.
*Fumaric acid	HN, MON, PPZ, USS.
Gluconic acid, technical	PPZ.
Glycolic acid (Hydroxyacetic acid)	DUP.
n-Hexadecylsuccinic anhydride	HMY.
Isothionic acid (2-Hydroxyethanesulfonic acid)	WTC.
Isoascorbic acid (Erythorbic acid)	PPZ.
Isobutyric acid	DA, EKY.
Isobutyric anhydride	EKT.
Isobutyl chloride	WTL.
Iso-octadecylsuccinic anhydride	HMY.
Ifaconic acid (Methylenesuccinic acid)	PPZ.
LACTIC ACID:	
Lactic acid, edible, 100%	CLW, MON.
Lauroyl chloride	ONX, UGP, WCC, WTL.
Malic acid	ACS, PFN, PPZ.
Malic acid	ACS.
Mercaptoacetic acid (Thioglycolic acid)	EVN.
3-Mercaptopropionic acid	EVN.
Mercaptosuccinic acid (Thiomalic acid)	EVN.
Methacrylic acid	DUP, RH.

*ACID, ACID ANHYDRIDES, AND ACYL HALIDES--Continued:	
Methanesulfonyl acid	PAS.
Methanesulfonyl chloride	PAS.
Neodecanoic acid	ENJ.
Neononanoic acid	ENJ.
Nonanoic acid (Pelargonic acid)	EMP, GIV.
Nonenylsuccinic anhydride	HNY.
Octanoyl chloride	WCC.
Octenylsuccinic anhydride	HNY.
Oleic acid	ASH.
Oleoyl chloride	HRT.
*Oxalic acid	ACS, HK, PFZ.
Palmitoyl chloride	PD.
Peroxyacetic acid	PHB, UCC.
Pivaloyl chloride	AZT, WCC.
Polyacrylic acid	BFG, DA, RH, SNW, X.
Propionic acid	CEL, EKT, IMC, UCC.
Propionic anhydride	EKT.
Sebacic acid	BAS, WTH.
Sebacoyl chloride	WTL.
Sorbic acid (2,4-Hexadienoic acid)	MON.
Stearoyl chloride	UOP.
Succinic acid	ACS.
Thioacetic acid	EVN.
3,3'-Thiodipropionic acid	CCM, EVN.
Thiolactic acid	EVN.
Trichloroacetic acid	DOM.
Valeric acid	UCC.
Acids, acid anhydrides, and acyl halides, all other	ABB, ARA, BCC, BFG, DOM, EK, ENJ, EVN, HMI, MIL, PIC, SCP, SK, TX, WAY, WCC, WTL.
*SALTS OF ORGANIC ACIDS:	
*ACETIC ACID SALTS:	
*Aluminum acetate	ACY, UCC.
*Ammonium acetate	ACS, BKC, MAL.
*Barium acetate	BKC, CRW, MAL.
Butyltin acetate (Di-butyltin diacetate)	X.
Calcium acetate	ACS, HPT, MAL.

Copper acetate	HSF, SHP, UCC.
Lead acetate	BKC.
Lead subacetate	ACS, BKC, MAL.
Lead tetraacetate	BKC, MAL.
*Magnesium acetate	ARA.
Manganese acetate	BKC, HCP, SHP.
Mercuric acetate	HSF, SHP.
Nickel acetate	MAL.
Potassium acetate	BKC, HSH, SHP.
*Sodium acetate	ACS, BKC, HCP, MAL, UCC.
Sodium diacetate	ACS, ATL, BKC, DAN, ERT, HCP, MAL, SCH, UCC.
*Zinc acetate	HCP, UCC.
Zirconium acetate	ACS, BKC, MAL, SHP, UCC.
Azirconium acetate	TZC.
Acetic acid salts, all other	MAL, REC, X.
Allylsulfonic acid, sodium salt	IOC, UOP.
Chloroacetic acid, sodium salt	DOW.
CITRIC ACID SALTS:	
Ammonium citrate	MAL, PPZ.
Calcium citrate	PPZ.
Ferric ammonium citrate	PPZ.
*Potassium citrate	HXL, MLS, PPZ.
*Sodium citrate	HXL, MLS, PPZ.
Citric acid salts, all other	X.
* 2-ETHYLHEXANOIC ACID (ALPHA-ETHYLCAPROIC ACID) SALTS:	
Aluminum 2-ethylhexanoate	DA, WOC, WTC.
Barium 2-ethylhexanoate	CCA.
Cadmium 2-ethylhexanoate	CCA.
*Calcium 2-ethylhexanoate	ARC, CCA, HW, MCI, TRO, WTC, X.
*Cobalt 2-ethylhexanoate	CCA, HM, MCI, SHP, TRO, WTC, X.
Copper 2-ethylhexanoate	CCA.
Iron 2-ethylhexanoate	CCA, HN.
*Lead 2-ethylhexanoate	CCA, HN, NTL, SHP, TRO, WTC, X.
Lithium 2-ethylhexanoate	WTC.
*Manganese 2-ethylhexanoate	CCA, HM, MCI, SHP, TRO, WTC, X.

SALTS--Continued:	
*Nickel 2-ethylhexanoate	MCI, SHP, WTC.
Potassium 2-ethylhexanoate	CCA, MCI.
Rare earths 2-ethylhexanoate	CCA, MCI.
Stannous 2-ethylhexanoate	WTC, X.
*Zinc 2-ethylhexanoate	CCA, HW, MCI, SHP, WTC, X.
*Zirconium 2-ethylhexanoate	CCA, HW, MCI, TRB, WTC, X.
2-Ethylhexanoic acid salts, all other--	MCI, SHP.
FORMIC ACID SALTS:	
Lead formate	NTL.
Potassium formate	HCP, SHP.
Sodium formate, refined	BKC.
Sodium formate, technical	CEL, PST, SCM.
Fumaric acid, lead salt	NTL.
GLUCOHEPTANOIC ACID SALTS:	
Sodium glucoheptanoate	PFN.
GLUCONIC ACID SALTS:	
Sodium gluconate	PPZ.
9H-Hexadecafluorooctanoic acid, ammonium salt	X.
Ascorbic acid, sodium salt (Sodium erythorbate)	PPZ.
Lauroleauric acid, dibutyltin salt	CCA, X.
Mercaptopropionic acid, dibutyltin salt	CCA.
Potassium glycolate	X.
Sodium ethyl oxalacetate	FPF.
TERTIARY-ALPHA-ALKYLCARBOXYLIC ACID SALTS (ISOCARBOXYLIC ACID SALTS):	
t- α -Alkylcarboxylic acid salts (Isocarboxylic acid salts), all other	WTC.
LACTIC ACID SALTS:	
Calcium lactate	HUM.
Sodium lactate (Nalac)	PFN.
Lactic acid salts, all other	TCC.
LAURIC ACID SALTS:	
Lauric acid, barium-cadmium salt	X.
Lauric acid salts, all other	X, X.
LIMOLEIC ACID SALTS:	
Calcium linoleate	CCA, SHP.

Cobalt linoleate	SHP.
Manganese linoleate	SHP.
*MALEIC ACID SALTS:	
Maleic acid, dibutyltin maleate salt	X.
Maleic acid, dibutyltin salt	CCA, X.
Maleic acid, tribasic lead salt	NFL.
Maleic acid salts, all other	CCA, X.
MERCAPTOACETIC ACID (THIOGLYCOLIC ACID) SALTS:	
Ammonium mercaptoacetate	EVN.
Calcium mercaptoacetate	EVN.
Potassium mercaptoacetate	EVN.
Sodium mercaptoacetate	EVN.
Mercaptoacetic acid (thioglycolic acid) salts, all other	CCA.
NEODECANOIC ACID SALTS:	
*Calcium neodecanoate	CCA, MCI, SHP.
Cobalt neodecanoate	MCI, SHP.
Lead-cobalt neodecanoate	MCI.
Lead neodecanoate	MCI.
Lithium neodecanoate	MCI, SHP.
Manganese neodecanoate	MCI, SHP.
Zinc neodecanoate	MCI, SHP.
Zirconium neodecanoate	MCI, SHP.
Neodecanoic acid salts, all other	MCI, SHP.
OCTANOIC-ACID (CAPRYLIC ACID) SALTS:	
Octanoic acid (caprylic acid) salts, all other	WTC.
OLEIC ACID SALTS:	
Copper oleate	WTC.
Stannous oleate	X.
Oleic acid salts, all other	SHP.
OXALIC ACID SALTS:	
Ammonium oxalate	ACS, BKC.
Potassium oxalate	BKC.
Sodium oxalate	BKC.
Oxalic acid salts, all other	SHP.

PHOSPHORODITHIOIC ACID SALTS (DITHIOPHOSPHATES):	
Sodium di-sec-butyl/diethyl phosphorodithioate	ACY.
Sodium di-sec-butyl phosphorodithioate	ACY.
Sodium diethyl phosphorodithioate	ACY.
Sodium dihexyl phosphorodithioate	ACY.
Sodium diisopropyl phosphorodithioate	ACY.
Phosphorodithioic acid salts (Dithiophosphates), all other	ACY.
PROPIONIC ACID SALTS:	
Calcium propionate	HPT, PFZ.
Sodium propionate	HPT, PFZ.
Propionic acid salts, all other	DUP, SHP, UCC.
RICINOLEIC ACID SALTS:	
Calcium ricinoleate	NPL.
Sodium sorbitol borate	ICL.
*STEARIC ACID SALTS:	
ALUMINUM STEARATES:	
*Aluminum distearate	DA, KCH, NOC, SYP, WTC.
*Aluminum monostearate	DA, NOC, SYP.
*Aluminum tristearate	DA, NOC, PEN, SYP, WTC.
Ammonium stearate	DA, DAN.
*Barium stearate	DA, NOC, PEN, SYP, WTC.
Cadmium stearate	NOC, WTC.
*Calcium stearate	DA, FER, HN, MAL, NOC, PEN, SNW, SYP, WTC, X.
Cobalt stearate	SHE, X.
Ferric stearate	SHE, WTC.
Lead stearate	WTC.
Lead stearate, dibasic	X.
Lithium stearate	DA, NOC, PEN, SYP, WTC.
*Magnesium stearate	DA, MAL, NOC, PEN, SYP, WTC.
Nickel stearate	WTC.
*Zinc stearate	DA, HN, MAL, NOC, PEN, PLS, SYP, WTC, X.
Stearic acid salts, all other	NOC, WTC.
TARTARIC ACID SALTS:	
Potassium sodium tartrate	PPZ.
XANTHIC ACID SALTS:	
Potassium amyloxanthate	DOW.

Potassium ethylxanthate-	DOM.
Potassium pentylxanthate-	ACY.
Sodium n-butylxanthate-	KCC, USR.
Sodium sec-butylxanthate-	DOM.
Sodium ethylxanthate-	DOM.
Sodium isobutylxanthate-	DOM.
Sodium isopropylxanthate-	DOM.
Salts of organic acids, all other-	CCA, EK, HSH, SDH, SHP, STP, WTC, X, X.
*ALDEHYDES:	
Acetaldehyde - - - - -	CEL, EKX, SHC, UCC.
Acrolein (Acrylaldehyde)-	SHC, UCC.
Butyraldehyde - - - - -	CEL, EKX, UCC.
Chloral (Trichloroacetaldehyde) -	MTO.
Crotonaldehyde - - - - -	EK, EKT, UCC.
2-Ethylbutyraldehyde - - - - -	UCC.
2-Ethylhexanal (α -Ethylcaproaldehyde) -	EKX, UCC.
2-Ethyl-2-hexen-1-al (2-Ethyl-3-propylacrolein)-	UCC.
*Formaldehyde (37% HCHO by weight) - - -	ACS, AMR, BOK, CBD, CEL, DUP, GAP, GOC, GP, HKD, HN, HPC, IMC, MON, RCI, WCL.
Glutaraldehyde - - - - -	UCC.
Glyoxal - - - - -	ACY, UCC.
Isobutyraldehyde - - - - -	CEL, DBC, EKX, UCC.
Isopentaldehyde, mixed isomers - - - -	UCC.
2-Methylvaleraldehyde (2-Methylpentaldehyde) -	UCC.
Propionaldehyde - - - - -	EKX, UCC.
Valeraldehyde (Pentanal) - - - - -	UCC.
Aldehydes, acyclic, all other - - - - -	EK, RDA, UCC, X.
*KETONES:	
*Acetone from cumene- - - - -	ACS, CLK, DOM, GP, GYR, MON, SHC, SKO, SOC, UCC, USS.
Acetone from isopropyl alcohol - - - -	EKT, ENJ, SHC, UCC.
Acetone, all other - - - - -	UCC.

Hydrocarbons, all other	CHV, HMY, SPS, SM, UCC.
Lauryl peroxide	WTC, WTL.
2-Mercaptoethanol	PLC.
Methyl sulfide (Dimethyl sulfide)	CRZ, PAS.
Methyl sulfoxide (Dimethyl sulfoxide)	CRZ.
ORGANO-ALUMINUM COMPOUNDS:	
Diethylaluminum chloride	TNA, TSA.
Diethylaluminum iodide	TSA.
Diisobutylaluminum chloride	TNA, TSA.
Diisobutylaluminum hydride	TNA, TSA.
Ethylaluminum dichloride	TNA, TSA.
Ethylaluminum sesquichloride	TNA, TSA.
Isopropenylaluminum	TSA.
Methylaluminum sesquichloride	TNA.
Triethylaluminum	TNA, TSA.
Triisobutylaluminum	TNA, TSA.

TABLE 1.--SYNTHETIC ORGANIC CHEMICALS: ALPHABETICAL DIRECTORY OF MANUFACTURERS, BY COMPANY, 1978

[Names of synthetic organic chemicals manufacturers that reported production and/or sales to the U.S. International Trade Commission for 1978 are listed below alphabetically, together with their identification codes as used in table 2 of the 15 individual sections of this report]

Identification code	Name of company	Office address
AEP	A & E Plastik Pak Co., Inc-----	14505 Proctor Ave., Industry, CA 91749.
AZS	AZS Corp.:	
	AZ Products Co. Div-----	2525 So. Combee Rd., Lakeland, FL 33801.
	AZS Chemical Co-----	762 Marietta Blvd., N.W., Atlanta, GA 30318.
ABB	Abbott Laboratories-----	14th St. and Sheridan Rd., N. Chicago, IL 60064.
ABS	Abex Corp., Friction Products Group-----	P. O. Box 3250, Winchester, VA 22601.
WLC	Agrico Chemical Co-----	P. O. Box 3166, Tulsa, OK 74101.
AGY	Agway, Inc., Olean Nitrogen Complex-----	1446 Buffalo St., Olean, NY 14760.
OH	Airco, Inc., Ohio Medical Products Div-----	3030 Airco Dr., P. O. Box 7550, Madison, WI 53701.
AIP	Air Products & Chemicals, Inc-----	P. O. Box 538, Allentown, PA 18105.
ALC	Alco Chemical Corp-----	Trenton Ave. and William St., Philadelphia, PA 19134.
AAC	Alcolac, Inc-----	3440 Fairfield Rd., Baltimore, MD 21226.
ALD	Aldrich Chemical Co., Inc-----	940 W. St. Paul Ave., Milwaukee, WI 53233.
ALL	Alliance Chemical Corp-----	33 Avenue P, Newark, NJ 07105.
	Allied Chemical Corp.:	
ACN	Agricultural Div-----	P. O. Box 2120, Houston, TX 77001.
ALF	Fibers Div-----	1411 Broadway - 38th Fl., New York, NY 10018.
ASC	Semet-Solvay Div-----	Columbia Rd., Morristown, NJ 07960.
ACS	Specialty Chemicals Div-----	P. O. Box 1219-R, Morristown, NJ 07960.
ACU	Union Texas Petroleum Div-----	P. O. Box 2120, Houston, TX 77001.
ALX	Alox Corp-----	3943 Buffalo Ave., Niagara Falls, NY 14303.
APH	Alpha Chemical Corp-----	P. O. Drawer A, Collierville, TN 38017.
ALP	Alpha Laboratories, Inc-----	1685 S. Fairfax St., Denver, CO 80222.
HES	Amerada Hess Corp. (Hess Oil Virgin Islands Corp.)-----	1 Hess Plaza, Woodridge, NJ 07095.
AMB	American Bio-Synthetics Corp-----	710 W. National Ave., P. O. Box 4275, Milwaukee, WI 53204.
MAR	American Can Co-----	American Lane, Greenwich, CT 06830.
AC	American Color & Chemical Corp-----	P. O. Box 51, Reading, PA 19603.
ACY	American Cyanamid Co-----	Wayne, NJ 07470.

U.S. IMPORTS OF BENZENOID CHEMICALS AND PRODUCTS

U.S. general imports of benzenoid chemicals and products entered under the Tariff Schedules of the United States (TSUS), schedule 4, part 1, subparts B and C are analyzed by the U.S. International Trade Commission annually and published in detail in a separate report.¹ General imports of benzenoid items entered in parts 1B and 1C totaled 487.6 million pounds with a foreign invoice value of \$663.0 million in 1978 compared with 412.5 million pounds with a foreign invoice value of \$570.5 million in 1977.

Benzenoid products that are "competitive" with similar domestic products, because they accomplish results substantially equal to those accomplished by the similar domestic product when used in substantially the same manner, are subject to a special basis of valuation for customs purposes known as the "American selling price." If "noncompetitive," the benzenoid products are valued for customs purposes on the basis of the "United States value." The essential difference between these two values is that "American selling price" is based on the wholesale price in the United States of the "competitive" domestic product, whereas "United States value" is based on the wholesale price in the United States of the imported product less most of the expenses incurred in bringing the product to the United States and selling it. When neither of these two valuation bases applies, then the "export value," "foreign value," or "constructed value" is used as the valuation basis under section 402 and 402a Tariff Act of 1930, as amended. The competitive status of benzenoid imports in 1977 is shown in table 2.

Industrial organic chemicals that are entered under part 1B consist chiefly of benzenoid intermediates and small quantities of acyclic compounds which are derived in whole or in part from benzenoid compounds. Also included are mixtures and small quantities of finished products not specially provided for in part 1C (e.g., rubber-processing chemicals). In terms of value, 33.1 percent of all the benzenoid imports under part 1B in 1978 came from West Germany; 19.4 percent, from Japan; 10.6 percent, from the United Kingdom; 7.5 percent, from France.

Finished organic chemical products entered under part 1C include dyes, pigments, medicinals, flavor and perfume materials, pesticides, plastics materials, and certain other specified products. In terms of value 33.2 percent of all finished benzenoid imports under part 1C in 1978 came from West Germany; 15.3 percent, from the United Kingdom; and 12.9 percent, from Japan.

¹All import entries in this group were "competitive" as defined in secs. 402 and 402a of the Tariff Act of 1930, as amended.

²Imports in this group are also "competitive." However, for each of the items in this group, there are some import entries which were appraised by the U.S. Customs Services as "noncompetitive" with like or similar U.S. products because at the time of exportation from the foreign country, the U.S. products were not freely offered for sale in the principal U.S. markets.

³Assessment of duties on import entries of items in this group were based on two or more import values during the year. Under the provisions of secs. 402 and 402a of the Tariff Act of 1930, as amended, each import shipment was valued either at the U.S. value, the export value, or the foreign value.

Source: Compiled by the U.S. International Trade Commission from records of the U.S. Bureau of Customs.

Note 1.--The totals shown in this table differ from those given in the official statistics of the U.S. Department of Commerce chiefly because of differences in coverage and in the methods used in compiling the data. In general, the statistics coverage in 1978 varies from a low of 53 percent for dyes, to about 88 percent coverage of flavor and perfume materials, 76 percent for intermediates, 70 percent of medicinals and pharmaceuticals, and 62 percent for organic pigments.

Note 2.--Because of rounding, figures may not add to the totals shown.

Common name	Standard (Chemical Abstracts) name
A Acid-----	3,5-Dihydroxy-2,7-naphthalenedisulfonic acid.
1,2,4-Acid-----	4-Amino-3-hydroxy-1-naphthalenesulfonic acid (1-Amino-2-naphthol-4-sulfonic acid).
Acid yellow 9-----	6-Amino-3,4'-azodibzenesulfonic acid.
p-Aminobenzenesulfonic acid-----	Sulfanilic acid and salt.
m-Aminobenzoic acid-----	4-Hydroxy-7-(m-aminobenzamido)-2-naphthalenesulfonic acid.
Aminoepiisobutyl acid-----	8-Amino-1,6-naphthalenedisulfonic acid.
Amino G acid-----	7-Amino-1,3-naphthalenedisulfonic acid.
Amino J acid-----	6-Amino-1,3-naphthalenedisulfonic acid.
Amino R salt-----	3-Amino-2,7-naphthalenedisulfonic acid.
Aniline oil-----	Aniline.
Anthraflavic acid-----	2,6-Dihydroxyanthraquinone.
Anthrarufin-----	1,5-Dihydroxyanthraquinone.
Armstrong & Wynne's acid-----	4-Hydroxy-2-naphthalenesulfonic acid.
B Acid-----	5-Amino-4-hydroxy-1,7-naphthalenedisulfonic acid.
2B Acid-----	6-Amino-4-chloro-m-toluenesulfonic acid.
4B Acid-----	6-Amino-m-toluenesulfonic acid.
Benzal chloride-----	α, β -Dichlorotoluene.
Benzanthrone-----	7H-Benz[de]anthracen-7-one.
Benzotrichloride-----	α, β, γ -Trichlorotoluene.
Bisphenol A-----	4,4'-Isopropylidenediphenol.
B.O.N-----	3-Hydroxy-2-naphthoic acid.
Broenner's acid-----	6-Amino-2-naphthalenesulfonic acid.
Bromamine acid-----	1-Amino-4-bromo-2-anthraquinonesulfonic acid.
Bromobenzanthrone-----	3-Bromo-7H-benz[de]anthracene-7-one.
C Acid (Cassella acid)-----	3-Amino-1,5-naphthalenedisulfonic acid.
C.A. Acid-----	3-Amino-6-chloro-4-sulfobenzoic acid.
C-Amine (Lake Red C acid)-----	2-Amino-5-chloro-p-toluenesulfonic acid.
Chicago Acid (SS acid)-----	4-Amino-5-hydroxy-1,3-naphthalenedisulfonic acid.
Chlorobenzanthrone-----	Chloro-7H-benz[de]anthracen-7-one.
Chromotropic acid-----	4,5-Dihydroxy-2,7-naphthalenedisulfonic acid.
Chrysazin-----	1,8-Dihydroxyanthraquinone.
1,6-Cleve's acid-----	5-Amino-2-naphthalenesulfonic acid.
1,7-Cleve's acid-----	8-Amino-2-naphthalenesulfonic acid.
Crocein acid-----	7-Hydroxy-1-naphthalenesulfonic acid.
2-Cyanopyridine-----	Picolinonitrile.
3-Cyanopyridine-----	Nicotinonitrile.
Cyanuric chloride-----	2,4,6-Trichloro-s-triazine.
D Acid-----	6-Amino-1-naphthalenesulfonic acid.
DADI-----	Dianisidine diisocyanate.
DBB-----	p-Dibutoxybenzene.
Decacylene-----	Diacenaphtho[1,2-j:1',2'-i]fluoranthene.
Dehydrothio-P-toluidine-----	2-(p-Aminophenyl)-6-methylbenzothiazole.
Developer Z-----	3-Methyl-1-phenyl-2-pyrazolin-5-one.
o-Dianisidine-----	3,3'-Dimethoxybenzidine.
1,1'-Dianthrilmide-----	1,1'-Iminodianthraquinone.
Dibenzanthrone-----	Violanthrone.
4,4'-Dihydroxydiphenylsulfone-----	4,4'-Sulfonyldiphenol.
Dimethyl POPOP-----	1,4-Bis[2-(4-methyl-5-phenyloxazolyl)]benzene.
4,5-Dinitrochrysazin-----	1,8-Dihydroxy-4,5-dinitroanthraquinone.
Dioxy S acid-----	4,5-Dihydroxy-1-naphthalenesulfonic acid.
Diphenyl Epsilon Acid-----	6,8-Dianilino-1-naphthalenesulfonic acid.
Durene-----	1,2,4,5-Tetramethylbenzene.
Epsilon Acid (Andresen's acid)-----	8-Hydroxy-1,6-naphthalenedisulfonic acid.
F Acid-----	7-Hydroxy-2-naphthalenesulfonic acid.
Fast Red G base-----	2-Nitro-p-toluidine [NH ₂ =1].
Fast Scarlet R base-----	5-Nitro-o-anisidine [NH ₂ =1].
Fischer's aldehyde-----	1,3,3-Trimethyl-L ² ,3'-indolineacetaldehyde.
Fischer's base-----	1,3,3-Trimethyl-2-methyleneindoline.
Freund's acid-----	4-Amino-2,7-naphthalenedisulfonic acid.

G salt-----	7-Hydroxy-1,3-naphthalenedisulfonic acid.
Gamma acid-----	6-Amino-4-hydroxy-2-naphthalenesulfonic acid, sodium salt.
Gold salt-----	9,10-Dihydro-9,10-dioxo-1-anthracenesulfonic acid and salt.
H Acid-----	4-Amino-5-hydroxy-2,7-naphthalenedisulfonic acid. (8-Amino-1-naphthol-3,6-disulfonic acid).
Hellimellitene-----	1,2,3-Trimethylbenzene.
Indoxyl-----	3(2H)-Indolone.
J Acid-----	7-Amino-4-hydroxy-2-naphthalenesulfonic acid, sodium salt.
J Acid Urea-----	7,7'-Ureylenebis[4-hydroxy-2-naphthalenesulfonic acid].
K Acid-----	4-Amino-5-hydroxy-1,7-naphthalenedisulfonic acid.
Koch's Acid-----	8-Amino-1,3,6-naphthalenetrisulfonic acid.
L Acid-----	5-Hydroxy-1-naphthalenesulfonic acid.
Lake Red C amine-----	2-Amino-5-chloro-p-toluenesulfonic acid.
Laurent's acid-----	5-Amino-1-naphthalenesulfonic acid.
M Acid-----	8-Amino-4-hydroxy-2-naphthalenesulfonic acid.
MEP-----	5-Ethyl-2-picoline (2-Methyl-5-ethylpyridine).
Mesitylene-----	1,3,5-Trimethylbenzene.
Methane base-----	4,4'-Methylenebis[N,N-dimethylaniline].
Michler's hydrol-----	4,4'-Bis[dimethylamino]benzhydrol.
Michler's ketone-----	4,4'-Bis[dimethylamino]benzophenone.
Naphthionic acid-----	4-Amino-1-naphthalenesulfonic acid.
o-Naphthionic acid-----	1-Amino-2-naphthalenesulfonic acid.
β-Naphthol-----	2-Naphthol, tech.
Naphthol AS-----	3-Hydroxy-2-naphthanilide.
α-Naphthylamine-----	1-Naphthylamine.
Neville & Weather's acid-----	4-Hydroxy-1-naphthalenesulfonic acid.
m-Nitrobenzoyl J acid-----	4-Hydroxy-7-(m-nitrobenzamido)-2-naphthalenesulfonic acid.
Oxy Koch's acid-----	1-Naphthol-3,6,8-trisulfonic acid.
Pentaanthrimide-----	1,4,5,8-Tetrakis(1-anthraquinonylamino)anthraquinone.
Peri Acid-----	8-Amino-1-naphthalenesulfonic acid.
Phenylbiphenyl-----	Terphenyl.
N-Phenyldiethanolamine-----	2,2'-(Phenyl)imino]diethanol.
Phenyl Gamma acid-----	6-Anilino-4-hydroxy-2-naphthalenesulfonic acid.
Phenyl J acid-----	7-Anilino-4-hydroxy-2-naphthalenesulfonic acid.
Phenyl peri acid-----	8-Anilino-1-naphthalenesulfonic acid.
POPOP-----	1,4-Bis[2-(5-phenyloxazolyl)]benzene.
Pseudocumene-----	1,2,4-Trimethylbenzene.
Pyrazoleanthrone-----	Anthra[1,9-cd]pyrazol-6(2H)-one.
Pyrazoleanthrone yellow-----	[3,3'-Bianthra[1,9-cd]pyrazole]-6,6'-(2H,2'H)dione.
Pyrazolone T-----	5-Oxo-1-(p-sulfofphenyl)-2-pyrazoline-3-carboxylic acid.
Quinizarin-----	1,4-Dihydroxyanthraquinone.
2-Quinizarinsulfonic acid-----	9,10-Dihydro-1,4-dihydroxy-9,10-dioxo-2-anthracenesulfonic acid.
Quinoline yellow base-----	Quinophthalone.
R Acid-----	3-Hydroxy-2,7-naphthalenedisulfonic acid, disodium salt.
RH acid (Violet acid)-----	4-Hydroxy-2,7-naphthalenedisulfonic acid.
Rhoduline acid (J Acid Imide)-----	7,7'-Iminobis[4-hydroxy-2-naphthalenesulfonic acid].
RR acid-----	3-Amino-5-hydroxy-2,7-naphthalenedisulfonic acid.
S Acid-----	4-Amino-5-hydroxy-1-naphthalenesulfonic acid.
Schafier's acid-----	6-Hydroxy-2-naphthalenesulfonic acid.
Silver salt-----	9,10-Dihydro-9,10-dioxo-2-anthracenesulfonic acid and salt.
